Summary

Apartment Investment and Management Company, also known as Aimco, has a sturdy portfolio of multi-family rental properties that are well-diversified, both in terms of geography and price point. This provides a stable source of cash flows. Also, the company has been advancing with its development and redevelopment strategy on the back of joint ventures and capital additions. Also, accretive buyouts will expand its portfolio and drive property net operating income (NOI), going forward. Moreover, Aimco has a decent balance sheet and liquidity position to sail through these uncertain times. However, amid the pandemic woes, fundamentals remain challenging, hindering rental rate and occupancy. Also, stiff competition from other housing alternatives and a high supply of rental apartments limit the company's ability to lease apartment units.

Overview

Headquartered in Denver, CO, Apartment Investment and Management Company — commonly known as Aimco — is a real estate investment trust (REIT) that is primarily engaged in the development and redevelopment of apartment communities, with opportunistic transactions focused primarily on the multi-family sector located in the United States.

The company also owns and invests in a diverse portfolio of high-quality multi-family, office, and retail assets in dynamic neighborhoods and urban markets nationwide — including Boston, Miami and San Diego. These stabilized properties produce stable cash flow and balance the risks and uncertain cash flows associated with its portfolio of development and redevelopments as well as value-add investments.

It operates in three segments, consisting of development and redevelopment, operating portfolio, and the other segment. The development and redevelopment segment consists of residential apartment communities, including related commercial spaces, which are under construction or have not achieved stabilization.

The operating portfolio comprises majority-owned and stabilized residential communities, while the other segment includes 1001 Brickell Bay Drive, Aimco's only commercial real estate property.

As of Dec 31, 2020, the company's operating portfolio segment comprised 24 apartment communities, with 6,067 apartment homes in 12 states and the District of Columbia. Also, the development and redevelopment segment included Upton Place and Hamilton on the Bay.

On Dec 15, 2020, Aimco completed its planned bifurcation of business into two separate publicly traded companies focused on ownership with active management and development, respectively. As part of the spin-off, Aimco separated its business into two publicly traded companies — Apartment Income REIT or AIR, which is a pure-play apartment investment vehicle, while Aimco retained the development and redevelopment of apartment communities.

Reasons To Buy:

- ▲ Aimco has a sturdy portfolio of operating properties that are well-diversified, both in terms of geography and price point, and situated in 12 states in the United States. This provides a stable source of cash flows. Specifically, the company's portfolio of operating properties consists primarily of market-rate apartment communities — including garden style, mid-rise, and high-rise apartments. Additionally, it owns Hamilton on the Bay and has a majority stake in 1001 Brickell Bay Drive and Upton Place. Average daily occupancy at its operating portfolio was 96.9% for the fourth quarter, sequentially up 190 basis points (bps). In 2020, Aimco collected 98.3% of residential rents due.
- ▲ The rise in demand for apartment properties driven by 'echo boomers' — children of the baby boomer generation — keeps us positive on the stock. This age cohort prefers to stay on their own. Added to this, due to changing lifestyle, people, on an average, are settling later in life and thereby delaying home purchase, leading to a rising tendency of living in a rented home. Hence, demand for Aimco's rental properties are expected to rise in the coming quarters.
- ▲ In December 2020, Aimco completed a spin off in efforts to reduce financial and execution risk, and simplify business. The first public entity — AIR — owns around 90% of the fair market value of assets while Aimco retained the remaining 10%. In fact, following the completion of the separation, the company retained its development and redevelopment business, 25 consolidated communities, and four partially-owned unconsolidated communities. Further, Aimco holds non-traditional assets like its investments in 1001 Brickell Bay Tower and loan to the partnership that owns Parkmerced Apartments. Aimco has been advancing with its development and redevelopment strategy on the back of joint ventures and capital additions. In fourth-quarter 2020, the company entered a joint venture for the development of a \$290-million mixed-use project, containing 689 apartment homes and around 100,000 square feet of retail space in the Washington, D.C. area. Moreover, in 2020, it acquired Hamilton on the Bay, which includes a 271-apartment home community and an adjacent 0.6-acre development site, with four residential homes in Miami's Edgewater neighborhood, for \$89.6 million. Such buyouts will likely increase the company's property NOI, going forward.
- ▲ Aimco has a decent balance sheet and liquidity position to sail through these uncertain times. As of Dec 31, 2020, the company's total liquidity of around \$449 million consisted of cash and restricted cash of approximately \$299 million as well as a borrowing capacity of \$150 million under its revolving credit facility. Moreover, non-recourse, property-level financing provides it with ample financial flexibility and sufficient funds to meet its near-term capital needs.

Aimco's portfolio diversity in terms of geography and price point, development and redevelopment efforts, accretive acquisitions, decent liquidity, and favorable demographics are positives.

Reasons To Sell:

- ▼ Apartment deliveries are expected to be elevated in a number of markets in the near term. The high supply is concerning because it curtails landlords' ability to command more rent and result in lesser absorption. Such an environment is predicted to continue in the near term, and is likely to result in aggressive rental concessions and moderate pricing power of landlords.
- ▼ The company's apartment communities face stiff competition from other housing alternatives such as rental apartments, condominiums and single-family homes. Such a competitive landscape limits its ability to lease apartment units and increase rental rates, thereby, restricting its growth momentum.
- ▼ The pandemic's adverse impacts on the economy and the job market environment are resulting in household contraction and consolidation. In addition, record-low mortgage rates have been driving the demand for existing and new-home purchases mainly for young-age cohorts, wherein homeownership rates have started to shoot up. Also, in 2020, the company incurred \$4.5 million of incremental costs related to the pandemic. As such, there is a reduced demand in many urban submarkets and any turnaround is unlikely until the health crisis is resolved.
- ▼ Aimco engages in developments and redevelopments that require significant investment. Although such projects are likely to improve NOI and have scope for higher-value creation, it increases the company's operational risks by exposing it to lease-up risks. Further, if the lead time required in developing projects increases, it could delay revenues generated from such projects and result in current-period earnings dilution.
- ▼ The majority of the company's properties are located in California, Chicago, Florida, and in the Northeast United States. Therefore, the performance of the company is susceptible to any adverse development in the general economic and political conditions of these regions.

Adverse impacts of the pandemic are likely to dent rental rates and occupancy for Aimco's properties. Geographic asset concentration and a competitive housing rental landscape are concerning.

Recent News

Aimco Completes Spin-Off of AIR – Dec 15, 2020

Aimco announced the completion of the spin-off of part of its business. With this, the company created two separate publicly traded companies — Apartment Income REIT Corp. or AIR and Aimco. Notably, Aimco retained its budding business of developing and redeveloping apartment communities. The company will continue to pursue other value-creating multifamily investments across the United States.

In fact, on Dec 15, the company completed a 1:1 pro rata distribution of share of Class A common stock of AIR for every share of Class A common stock of Aimco held by shareholders of record as of Dec 5, 2020.

Additionally, common stock of AIR — a pure-play apartment investment vehicle — started trading on the NYSE under the symbol “AIRC”.

Aimco Announces Spin-Off, \$2.4B Joint Venture – Sep 14, 2020

Aimco announced plans to bifurcate its business into two separate publicly traded companies focused on ownership with active management and development, respectively. The company also entered a ten-year JV for joint ownership of 12 multi-family properties in California.

Spin-Off Transaction Details

As part of the spin-off, Aimco will separate its business into two publicly traded companies — AIR, which will be a pure-play apartment investment vehicle, while Aimco will retain the development and redevelopment of apartment communities.

AIR will own 93.5% of a portfolio of 98 stabilized properties that have 26,599 apartment homes, with fair market value (or GAV) of \$10.4 billion and net asset value (NAV) of \$7.8 billion. These communities are primarily A/B in quality and provide diversification across geography and price points.

The strategic location of the properties across submarkets with above-average growth projections likely enabled the assets to enjoy above-average market rents as well as decent NOI margins and occupancy rates.

AIR will operate at low leverage and a conservative capital structure. It will have debt, net of cash and receivables of \$2.7 billion, indicating net debt to annualized EBITDA of 5.9X for the March-end quarter.

Meanwhile, Aimco will retain the ownership of 11 stabilized multi-family properties, the loan made to the partnership owning Parkmerced Apartments and the related option to extend the same, the land assembly of Yacht Club, and an office building in Miami, 1001 Brickell Bay Tower.

Moreover, the company's portfolio will include Hamilton on the Bay, a multi-family property that was recently purchased, and the land and zoning to develop 389 additional apartment homes, as well as other assets and liabilities. Aimco expects the fair market value or GAV of these properties to be \$1.3 billion. The properties are subject to property debt of \$0.2 billion. This along with \$0.1 billion of cash is likely to result in an expected NAV of \$1.2 billion.

The 1:1 split will enable Aimco shareholders to receive a share of AIR for each owned share of Aimco. Moreover, the planned transaction is expected to be a taxable event, enabling the reduction of the tax burden for future taxable transactions and the need for continued non-cash stock dividends in compliance with REIT requirements.

Additionally, AIR will be headquartered in Denver, CO, while Aimco will be based in Bethesda, MD, as well as Denver.

Transaction Rationale

The spin-off will facilitate Aimco to simplify its business, and focus on a pipeline of redevelopment and development opportunities as well as additional scope to pursue real estate opportunities in partnership with AIR.

In fact, five of AIR's properties are currently under construction or in lease-up and will likely be so at the time of the separation. Per plans, the five properties will be leased to Aimco to complete the work. The net leases are estimated to contribute \$25 million annually or around 5% of AIR's NOI.

Moreover, since AIR will not be involved in development and redevelopment activities, it can eliminate earnings dilution from properties with reduced or no earnings from such activities. This along with lower management costs is likely to result in higher FFO. Higher FFO also supports increased levels of dividends.

JV Transaction Details

Aimco entered a ten-year JV with a passive institutional investor for 12 multi-family properties, consisting of 4,051 units in California.

These properties are valued at \$2.4 billion, indicating an implied NOI cap rate and free cash flow cap rate of approximately 4.2% and 4%, respectively (based on annualized figures for the six months ended Jun 30, 2020). The properties have an implied equity value of \$1.18 billion and non-recourse debt of \$1.22 billion.

The company has sold a 39% stake in the properties, subject to \$475 million of property debt, for \$461 million cash and an additional \$24 million for future redevelopment spending. Along with the remaining 61% interest, Aimco will be responsible for the operations of the properties, enabling it to earn property and asset management fees.

The transaction is a strategic fit as it allows the company to reduce financial leverage by 1.2X. Moreover, it aids in reducing capital allocation to California, while providing proceeds to invest in other target markets, thereby, demonstrating its plan to rebalance capital allocation across its markets.

Markedly, the properties are anticipated to be owned by AIR post separation.

Dividend Update

Aimco's 2020 property sales, including stake sale in its California properties, resulted in taxable gains in excess of its regular quarterly dividend. This enabled its board of directors to announce a special dividend amounting to \$8.20 per share in the form of cash and stock. This special dividend includes the upcoming two quarterly cash dividends, aggregating 82 cents per share and \$7.38 per share in stock.

Accordingly, the company paid out \$121.8 million in cash and 35,386,723 shares of common stock on Nov 30, 2020, as special dividend to shareholders of record as of Nov 4, 2020.

In efforts to offset the dilutive impact of the stock issued in the special dividend, the company's board also authorized a 1-for-1.23821 reverse stock split, effective Nov 30, 2020. This will result in the total shares outstanding remaining unchanged.

Valuation

Aimco's shares have been down 86.9% over the trailing 12-month period. Stocks in the Zacks sub-industry have rallied 10.6%, while the Zacks Finance sector has gained 46.8%, over the past year.

The S&P 500 Index is up 52.8% in the past year.

The stock is currently trading at 2.52X forward 12-month FFO, which compares to 21.52X for the Zacks sub-industry, 17.27X for the Zacks sector and 23.06X for the S&P 500 Index.

Over the past five years, the stock has traded as high as 21.32X and as low as 1.59X, with a 5-year median of 17.52X. Our neutral recommendation indicates that the stock will perform in line with the market. Our \$6.75 price target reflects 2.73X FFO.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	A
Growth Score	F
Momentum Score	F
VGM Score	D

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Disclosures

Investing involves risk; principal loss is possible. There is no guarantee that companies that can issue dividends will declare, continue to pay or increase dividends.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
