Summary

Akin to the other carriers, Alaska Air is suffering from passenger-revenue-related woes. Notably, the carrier expects revenue passengers to plummet 55% in first-quarter 2021 from the level reported in the March quarter of 2019. Further, the airline estimates total revenues to decline 57.5% in the same period from first-quarter 2019 levels. With travel demand below 2019 levels amid coronavirus-led woes, Alaska Air expects capacity to contract approximately 33% in the period from the 2019 reported levels. Amid coronavirus-related adversities, low fuel prices (down 27.9% in 2020) offered some relief in 2020. Additionally, improvement in travel demand with increased vaccinations and easing coronavirus-led restrictions is a boon for the company. In such a scenario, the airline's joining of the oneworld alliance adds to the positivity.

Overview

Alaska Air Group, together with its partner regional carriers, serves more than 100 cities across North America. The carrier's mainline operating fleet includes 166 B737 jet aircrafts and 31 Airbus A320 family jets. Its regional operations include flights operated by Horizon Air, which was acquired in 1986 and SkyWest. The carrier's mainline and regional fleet strength at the end of 2020 was 197 and 94 respectively. The carrier serves more than 115 destinations.

Horizon Air, which serves nearly 7 million passengers annually, sells its entire capacity to Alaska Airlines under a capacity purchase arrangement. Alaska Airlines was founded in 1932. The regional fleet operated by SkyWest had 32 E175 planes at the end of 2020.

Alaska Air Group, through its mainline operations, covers western United States, Canada and Mexico. It also offers passenger and cargo services to/within Alaska.

Furthermore, the company operates on long-haul east/west routes to Hawaii and multiple cities in the mid-continental and eastern United States, primarily from Seattle.

The bulk of the company's revenue is generated through passenger operations. In 2020, passenger revenues contributed 85% (of which 83.1% came from mainline operations) to the company's top line of \$3,566 million. Mileage Plan and cargo and other revenues contributed 10% and 5% respectively to the company's top line in 2020.

In 2020, the carrier announced the West Coast International Alliance with American Airlines, which will provide more destinations, greater utility and more value for our guests and loyalty members. The alliance will allow Alaska Mileage Plan members to enjoy benefits across both airlines by early spring 2021.

Such customer-friendly arrangements boost the top line of Alaska Air Group. The acquisition of Virgin America, completed in Dec 2016, has significantly expanded Alaska Air Group's presence.

Alaska Air Group is based in Seattle, WA. The company's fiscal year coincides with the calendar year.

Reasons To Buy:

- ▲ Alaska Air's expansion initiatives are encouraging. Starting Mar 18, 2021, the airline began daily non-stop service connecting Los Angeles and Austin. Moreover, in March, the carrier announced plans to expand its Pacific Northwest network as air-travel demand continues to improve. The airline will introduce four new services connecting Boise, ID with Chicago, IL and Austin, TX, as well as Seattle, WA with Idaho Falls, ID and Redding, CA. These services, set to be launched in time for the summer season, are expected to attract traffic. Effective Jun 17, the carrier will begin daily non-stop service connecting Boise with Chicago O'Hare and Austin. Additionally, the airline will commence a new seasonal non-stop service between Anchorage and Minneapolis-St. Paul in June.
- ▲ With fuel expenses comprising a major chunk of airline expenditures, low fuel costs partly offset adversities in 2020. Notably, fuel prices declined 27.9% year over year in 2020. The savings on fuel costs supported the bottom line.
- ▲ With increased vaccinations and easing coronavirus-led restrictions, the airline saw a substantial improvement in its March demand. Total revenues in the month declined 52% from the 2019 levels, much better than the 69% decrease in February. Further the carrier improved its load factor (percentage of seats filled with passengers) guidance for the first quarter. Alaska Air anticipates load factor to be 52% in the first quarter, compared with the previous expectation of the same in the range of 45-50%. First-quarter results will be available on Apr 22.
- ▲ Alaska Air's joining of the oneworld alliance at a time when air-travel is continuing to recover with more people getting vaccinated is a major positive. As part of oneworld, the airline will be able to strengthen its global network to cover as many as 1,000 destinations across more than 170 countries and territories. With this membership, the carrier will add seven new airline partners and enhance its existing partnerships with six oneworld members.

Alaska Air's expansion initiatives to take advantage of the gradually recovering travel demand are noteworthy.

Reasons To Sell:

- ▼ Amid coronavirus-led weak air-travel demand, Alaska Air is suffering significant loss of passenger revenues, which plunged 63% year over year in 2020. Notably, the carrier incurred losses in each of four quarters of 2020. In order to match capacity with the current demand scenario, the carrier reduced capacity by 44.3% in 2020. The airline anticipates first-quarter 2021 capacity (measured in available seat miles) to be down approximately 33% from the March-quarter 2019 actuals. With this reduction in capacity, the airline anticipates non-fuel unit costs to increase 21% in the first quarter of 2021 from the 2019 levels. This might have hurt the bottom line in the first quarter.
- ▼ Akin to other carriers, Alaska Air is suffering from passenger-revenue related woes. Notably, the carrier expects revenue passengers to plummet 55% in first-quarter 2021, from the level reported in the March quarter of 2019. Total revenues for first-quarter 2021 are predicted to decline 57.5% from the first-quarter 2019 levels.
- ▼ The increasing debt-to-capitalization ratio at Alaska Air is not favorable. A higher ratio result means that a company is more highly leveraged, which carries a higher risk of insolvency. Inclusive of operating leases, debt-to-capitalization ratio was 61% at the end of the fourth quarter compared with 41% at the end of December 2019.

Alaska Air is suffering significant loss of passenger revenues due to coronavirus-led travel demand woes.

Last Earnings Report

Alaska Air Posts Loss in Q4

Alaska Air incurred a loss of \$2.55 per share (excluding 92 cents from non-recurring items) in the fourth quarter of 2020, narrower than the Zacks Consensus Estimate of a loss of \$2.91.

Revenues came in at \$808 million, surpassing the Zacks Consensus Estimate of \$786.6 million. The top line, however, declined 63.7% year over year. Passenger revenues — contributing 81.3% to the top line — were down 68% on a year-over-year basis to \$658 million due to weak travel demand.

Quarter Ending 12/2020

Report Date	Jan 26, 2021
Sales Surprise	2.72%
EPS Surprise	12.37%
Quarterly EPS	-2.55
Annual EPS (TTM)	-10.14

Other Details

Consolidated traffic, measured in revenue passenger miles, fell 68.7% year over year in the reported quarter. Consolidated capacity (measured in available seat miles) dropped 42.1%. Load factor (percentage of seats occupied by passengers) deteriorated 38.4 points to 45.3% as traffic plunged more than the amount of capacity contraction. Total revenue per available seat mile (RASM: a key measure of unit revenues) slumped 37.3% year over year to 8.39 cents in the reported quarter. Meanwhile, yield inched up 2% to 15.06 cents.

In the fourth quarter, total operating expenses (on a reported basis) dropped 30% year over year to \$1,381 million. Consolidated fuel price (economic) was \$1.39 per gallon, tumbling 37.1% year over year. With most of the fleet remaining grounded/under-utilized, fuel gallons consumed were down 45.9% to \$117 million. Consolidated cost per available seat mile excluding fuel and special items (non-fuel unit costs) increased 26% to 11.35 cents, mainly due to capacity cuts.

Liquidity

As of Dec 31, 2020, the company had \$3,346 million in cash and marketable securities compared with \$1,521 million at the end of 2019. The company exited the final quarter of 2020 with long-term debt of \$2,357 million compared with \$1,264 million at the end of 2019. Inclusive of operating leases, debt-to-capitalization ratio was 61% compared with 41% at the end of December 2019.

Moreover, on Jan 15, 2021, the carrier received \$266 million of the total amount of \$533 million from the U.S. Treasury. Notably, Alaska Air reached an agreement with the U.S. treasury in January 2021 to receive an extension of the payroll support amounting to \$533 million.

Alaska Air's total liquidity as of Jan 22, 2021 stood at \$5.2 billion.

Q1 Outlook

For the first quarter of 2021, the carrier expects capacity to decline roughly 30% from the comparable reported figure of first-quarter 2019. Revenue passengers are likely to plummet in the 60-65% range during first-quarter 2021 from the level reported in the March quarter of 2019.

Total revenues are also likely to decline in the 60-65% range during first-quarter 2021 from the March-quarter 2019 actuals. Passenger load factor in the quarter is expected in the 40-45% range. Non-fuel unit costs for first-quarter 2021 are likely to increase approximately 20% from the recorded first-quarter 2019 levels. Alaska Air

Recent News

14th Member of Oneworld — Apr 1, 2021

Alaska Air Group's subsidiary, Alaska Airlines, has joined the oneworld alliance as its 14th full member. As part of oneworld, Alaska Airlines will be able to strengthen its global network to cover as many as 1,000 destinations across more than 170 countries and territories. With this membership, the carrier will add seven new airline partners and enhance its existing partnerships with six oneworld members.

With this membership, Alaska Airlines customers who are members of Alaska Mileage Plan can now earn miles when they travel on any of the other 13 members, which include American Airlines, British Airways, Cathay Pacific Airways and Qatar Airways, among others. Mileage redemption on airlines with which Alaska Airlines did not have previous partnerships, will begin in the coming months. Additionally, the airline's elite Mileage Plan members will enjoy privileges such as access to more than 650 international first and business class lounges, and priority check-in and boarding.

Expansion Update — Mar 19, 2021

In a bid to meet the anticipated surge in air-travel demand during summer, Alaska Airlines announced that it will commence a new seasonal nonstop service between Anchorage and Minneapolis-St. Paul in June. The added service means that Alaska Airlines will now offer more nonstop flights from Alaska than any other airline.

Commencing Jun 19, the Anchorage to Minneapolis flight will operate only on Saturdays and Sundays. The seasonal service will end on Aug 15.

Valuation

Alaska Air shares are up 32.3% and more than 100% in the year-to-date period and over the trailing 12-month period respectively. Stocks in the Zacks sub-industry and the Zacks Transportation sector are up 9.5% and 7.3% in the year-to-date period, respectively. Over the past year, the Zacks sub-industry and the sector are up 87.2% and 66% respectively.

The S&P 500 index is up 11% and 50.6% in the year-to-date period and in the past year respectively.

The stock is currently trading at 1.31X forward 12-month price to sales, which compares to 0.9X for the Zacks sub-industry, 1.6X for the Zacks sector and 4.77X for the S&P 500 Index.

Over the past five years, the stock has traded as high as 1.89X and as low as 0.33X, with a 5-year median of 0.94X. Our Neutral recommendation indicates that the stock will perform in-line with the market. Our \$70 price target reflects 1.37X forward 12-month sales.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	F
Momentum Score	A
VGM Score	D

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
