Summary

AptarGroup anticipates third-quarter 2020 adjusted earnings per share between 80 cents and 88 cents. The mid-point of the range projects a year-over-year drop of 10%. Increasing demand for pharmaceutical products amid the COVID-19 pandemic is likely to drive the Pharma segment. However, weak beauty products sales due to store closures and travel restrictions will offset some of the gains. Also, the Food + Beverage segment continues to be hurt by lower food service and on-the-go beverage closure sales. Nevertheless, the company's cost control measures will aid margins. AptarGroup's ongoing business-transformation plan to aid top-line growth, boost operational excellence, enhance approach to innovation and improve organizational effectiveness will drive growth. Acquisitions and efforts to launch innovative products also remain catalysts.

Overview

Headquartered in Crystal Lake, IL, AptarGroup is a global supplier of a broad range of innovative dispensing, sealing and active packaging solutions for the beauty, personal care, home care, prescription drug, consumer health care, injectables, food and beverage markets. Its main products include dispensing pumps, closures, aerosol valves and elastomeric primary packaging components. The company has manufacturing facilities across the globe including North America, Europe, Asia and South America. The company's primary products are dispensing pumps, closures, aerosol valves and elastomeric primary packaging components.

AptarGroup operates through three market-focused business segments - Beauty + Home, Pharma, and Food + Beverage.

The **Beauty + Home** segment (47% of AptarGroup's sales in fiscal 2019) consists of operations that sell dispensing systems primarily to the beauty, personal care and home care markets. The segment sells pumps, closures, aerosol valves and accessories to the personal care and home care markets and pumps and decorative components to the beauty market. Sales to the beauty, the personal care and the home care market accounted for approximately 49%, 44% and 7%, respectively, of the segment's total net sales in 2018.

The **Pharma** segment (38%) sells dispensing systems or primary packaging components to the prescription drug, consumer health care and injectables markets. AptarGroup is the leading supplier of pumps and metered dose inhaler valves (MDIs) to the pharmaceutical market worldwide and is the number three supplier of elastomer primary packaging components worldwide. Sales to the prescription drug market generated around 52% of the segment's total net sales in 2018. The consumer health care market accounted for approximately 27% of the segment's total net sales in 2018, while the injectables market accounted for approximately 17%.

The **Food + Beverage** segment (15%) sells dispensing closures and as well as non-dispensing closures, spray pumps and aerosol valves to the food and beverage markets. Sales to the food market accounted for approximately 64% of the segment's total net sales in 2018, while the beverage market accounted for the balance 36%.

Source: Zacks Investment Research

Reasons To Buy:

▲ AptarGroup is focused to grow on business-transformation plan to drive top-line growth, boost operational excellence, enhance its approach to innovation and improve organizational effectiveness. The company remains on track with its business transformation which primarily focuses on streamlining the Beauty + Home segment. In sync with the plan, AptarGroup has decided to close Stratford and Torrington, CT sites by the end of the current year and consolidate this production capacity into other AptarGroup's existing North American facilities. This measure will support North American Beauty + Home customers more efficiently while focusing on long-term, profitable growth.

▲ AptarGroup remains committed to expand its business through acquisitions to expand the scope of technologies, geographic presence and product offerings. AptarGroup completed strategic equity investments in BTY, a leading Chinese provider of decorative and complete color cosmetics packaging solutions. The acquisition will help to capitalize on the high-growth Asian color cosmetics market. The company has also acquired Fusion Packaging, a leader in high quality, prestige airless and color cosmetics packaging, and conception-to-launch turnkey solutions for the North American beauty market. Both acquisitions will be accretive to the Beauty and Home segment's margin. It has also entered into a partnership with digital platform provider, Sonmol, to bring to market new connected platforms for respiratory-related therapies.

AptarGroup had previously acquired Nanopharm and Gateway Analytical, which is likely to expand its service portfolio that supports pharmaceutical and biotech customers. Last year, the company acquired CSP Technologies, a leader in active packaging technology based on proprietary material science expertise. AptarGroup also acquired Noble International, which is a leader in drug delivery training devices and patient onboarding. The acquisition is in sync with AptarGroup's strategy to broaden service portfolio for pharmaceutical and biotech customers. It strengthens the company's position in an attractive, rapidly growing market segment (device trainers and compliance monitoring).

▲ As of Jun 30, 2020, AptarGroup had available cash and equivalents of approximately \$248 million. Total debt to total capital ratio was 0.44 as of Jun 30, 2020. The company's times interest earned ratio has been improving over the past few years, and is currently at 9.3 and much higher than the industry's times interest earned ratio of 3.9. This indicates that the company is in a position to fulfill its debt obligations.

▲ The Pharma segment witnessed sales growth across each end market with particularly strong growth in the injectables and active packaging businesses. This is likely to persist amid the coronavirus pandemic. Notably, the segment has identified over 150 potential projects as a result of the COVID-19 pandemic and continues to receive inquiries from the healthcare industry on an almost-daily basis. In the wake of the ongoing uncertainty related to the COVID-19, the company has undertaken several cost control measures, which include reducing temporary labor headcount, regional and site-specific furloughs and wage reductions, elimination of business travel. The company has also cut down on discretionary spending and modifying production schedules. This will help sustain margins despite low volumes.

▲ AptarGroup is poised to gain from innovative product launches. In the Pharma segment, AptarGroup's active material sciences technologies is featured on U.S FDA approved implantable rechargeable device used to treat urinary and bowel dysfunction by Axonics Modulation Technologies. Also, AptarGroup's multidose nasal pump features in a new drug application Gimoti — the first and only U.S FDA approved nasally administered treatment for relieving symptoms of acute and recurrent diabetic gastroparesis. Its ophthalmic squeeze dispenser is now featured on allergy, anti-inflammatory and dry eye products by Synthesis, which is part of Abbott in Latin America.

In the Beauty + Home segment, AptarGroup's spray pump featured on a line of Suave hand sanitizer sprays by Unilever. The company's closure and SimpliSqueeze valve was chosen by Dial for the innovative body wash and easy squeeze stand-up pouch. In the Food + Beverage segment, the company's closure with SimpliSqueeze valve has been chosen by a major peanut butter brand and also featured on a new line of signature sauces and condiments of Chik-Fil-A in the United States. In the beverage market, sports closure has been used in a new sports drinks by Xiaoyangren in China.

AptarGroup is poised to gain from business-transformation plan to drive top-line growth and improve organizational effectiveness. Innovative product launches and acquisitions will also fuel growth.

Reasons To Sell:

- ▼ The Beauty + Home segment will continue to be negatively impacted by reduced orders from customers providing prestige beauty products. Beauty products are sold via duty free travel and retail stores. Consequently, the restrictions on air travel has impacted the beauty market. Also, many beauty retailers have shut down in response to government mandates to stem the spread of the coronavirus. Notably beauty products account for 24% of the company's revenues. The Food + Beverage segment will continue to be negatively impacted by decrease in food service and on-the-go beverage closure sales due to the COVID-19 crisis.
- ▼ AptarGroup now projects adjusted EPS for third-quarter 2020 between 80 cents and 88 cents. The mid-point of the guided range reflects a year-over-year decline of 10% from earnings per share of 93 cents reported in the prior-year quarter. The guidance factors in resumption of air travel, the reopening of retail and revival in consumer spending confidence. The recent spike in COVID-19 cases across several regions of the world has led to economic uncertainty in some of the company's markets.
- ▼ The allergy category, which is a significant part of the pharma business, has been delivering above-average performance over the last 12 to 18 months. This can be attributed to the huge success of the branded treatments being now sold over-the-counter in significant quantities. The company expects growth to normalize in the near term.
- ▼ AptarGroup expects to incur implementation costs of approximately \$125 million related to business-transformation plan in the Beauty + Home segment. These costs remain a drag for earnings in the near term. AptarGroup's results will bear the brunt of fluctuation in foreign currency rates. The company has primary foreign exchange exposure to the euro, in addition to the Chinese yuan, Brazilian real, Mexican peso, Swiss franc and other Asian, European and South American currencies. A strengthening U.S. dollar relative to foreign currencies has an effect on financial statements.

AptarGroup will continue to bear the impact of the coronavirus pandemic on its end markets, particularly in the Beauty + Home and Food + Beverage segments, until the situation stabilizes.

Last Earnings Report

AptarGroup's Earnings & Sales Beat Estimates in Q2

AptarGroup delivered second-quarter 2020 adjusted earnings per share of 80 cents, which surpassed the Zacks Consensus Estimate of 68 cents. However, the bottom line declined 30% year over year.

On a reported basis, earnings came in at 63 cents per share compared with the year-ago quarter's \$1.12 per share.

Total revenues declined 6% year over year to \$699.3 million in the June-end quarter due to negative impacts of the coronavirus pandemic on the beauty and beverage markets, changes in currency exchange rates and passing on lower resin costs. These negatives were offset by contributions from acquisitions. The top line beat the Zacks Consensus Estimate of \$655 million. Core sales, excluding currency and acquisition effects, dropped 6% year over year. Sales growth witnessed in the Pharma segment was partly offset by declines in Beauty + Home and Food + Beverage segments.

Quarter Ending	06/2020
Report Date	Jul 30, 2020
Sales Surprise	6.76%
EPS Surprise	17.65%
Quarterly EPS	0.80
Annual EPS (TTM)	3.46

Operational Update

Cost of sales was down 5.8% year over year to \$442 million. Gross profit fell 6% year over year to \$257.3 million. Gross margin came in at around 37% during the second quarter, unchanged from the prior-year quarter's figure.

Selling, research, development and administrative expenses flared up 7.9% year over year to \$123 million. Adjusted operating income went down 26.5% year over year to \$83 million. Operating margin came in at 11.8% in the quarter, down from the year-ago quarter's 15.2%. Adjusted EBITDA declined 14.3% year over year to \$137 million in the April-June quarter.

Segmental Performance

Total revenues in the Beauty + Homes segment declined 12.4% year over year to \$299.8 million. Adjusted operating income in the second quarter plummeted 97.4% year over year to \$0.7 million.

Total revenues in the Pharma segment rose 6.7% year over year to \$301 million. Adjusted operating income came in at \$86 million in the June-end quarter, flat year over year.

Total revenues in the Food + Beverage segment were down 17.6% year over year to \$98 million. Operating income slid 30.1% year over year to \$8.6 million.

Financial Performance

AptarGroup reported cash and cash equivalents of \$247.6 million as of Jun 30, 2020, up from \$242 million as of Dec 31, 2019. The company generated \$228 million of cash flow from operations in the first half of the current year compared with \$221 million in the first half of 2019. As of Jun 30, 2020, long-term debt was approximately \$1,083 million, down from \$1,085 million as of Dec 31, 2019.

Outlook

The company expects to witness economic uncertainty in some of its markets owing to the recent spike in coronavirus cases in many regions of the world. However, AptarGroup expects gradual improvement in the second half of the year based on the resumption of travel activity, the reopening of retail stores and consumer spending. Considering these factors, the company anticipates third-quarter adjusted earnings per share in the range of 80 cents to 88 cents.

Valuation

AptarGroup's shares have gone up 0.4% in the year-to-date period and down 2.9% over the trailing 12-month period. Stocks in the Zacks Containers – Paper and Packaging industry and the Zacks Industrial Products sector are down 4.5% and 3.0% in the year-to-date period, respectively. Over the past year, the Zacks sub-industry and the sector are up 5.1% and 8.0%, respectively.

The S&P 500 index is up 3.6% in the year-to-date period and up 12.5% in the past year.

The stock is currently trading at 31.24X forward 12-month earnings, which compares with 15.38X for the Zacks sub-industry, 21.27X for the Zacks sector and 22.19X for the S&P 500 index.

Over the past five years, the stock has traded as high as 34.35X and as low as 20.39X, with a 5-year median of 23.85X.

Our Neutral recommendation indicates that the stock will perform in-line with the market. Our \$126 price target reflects 33.16X forward 12-month earnings.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	B
Momentum Score	C
VGM Score	B

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
