Summary

Shares of Credit Acceptance have underperformed the industry so far this year. Its earnings outpaced the Zacks Consensus Estimate in one and lagged in three of the trailing four quarters. Earnings estimates have been stable ahead of its third-quarter results. Increase in finance charges, driven by a rise in demand for consumer loans, is expected to support the company's profits. Improvement in dealer enrollments and active dealers (despite tough competition) is a positive for the company, which is expected to further support revenues. Further, its steady capital deployment activities are commendable. However, elevated expenses, owing to an increase in compensation and marketing costs, will likely hurt the bottom line to an extent. Further, deteriorating credit quality and high levels of debt are other key concerns and might hamper financials.

Overview

Headquartered in Southfield, MI, Credit Acceptance Corporation is a credit services company. The company, founded in 1972, operates through one segment. The segment primarily focuses on offering financing programs, and related products and services to automobile dealers in the United States enabling them to sell vehicles to consumers irrespective of their credit history.

Credit Acceptance offers financing programs through a country-wide network of automobile dealers. These dealers benefit from sales of vehicles to consumers who otherwise could not obtain financing; from repeat and referral sales generated by these same customers; and from sales to customers responding to advertisements for financing programs but actually end up qualifying for traditional financing.

Credit Acceptance has two loan programs:

- **Portfolio Program:** Under this, the company gives money to dealers (called Dealer Loans) in exchange for the right to service the underlying Consumer Loan.
- **Purchase Program:** Under this, the company buys Consumer Loans from the dealers (called Purchased Loan) and keeps all the money collected from the consumer.

Further, Credit Acceptance through its wholly-owned subsidiary, VSC Re Company, is engaged in the business of reinsuring coverage under vehicle service contracts sold to consumers by dealers on vehicles financed by the company.

As of Jun 30, 2020, Credit Acceptance had net loans receivable of \$6.75 billion, total assets of \$7.34 billion, cash and cash equivalents (including restricted cash) of \$391.2 million, and total stockholders' equity of \$2.07 billion.

Source: Zacks Investment Research

Reasons To Buy:

- ▲ Revenue growth remains a major positive for Credit Acceptance. The company's top line has witnessed a six-year (2014-2019) compound annual growth rate (CAGR) of 15.5%, with the uptrend continuing in the first six months of 2020. Growth is primarily attributable to steady rise in finance charges, which is also the main revenue component (accounting for 93% of total revenues in the first half of 2020). Despite the current economic crisis resulting from the coronavirus outbreak, finance charges are likely to continue improving supported by rise in demand for auto loans. A decent rise in dealer enrollments and active dealers is also expected to aid the company's top line.
- ▲ Credit Acceptance believes in returning capital to shareholders through stock repurchases instead of paying dividends. In March 2020, it authorized additional 3 million shares to be repurchased (in addition to the previous authorizations). As of Jun 30, 2020, the company had 3.1 million shares left to be repurchased. Despite having a substantial debt burden, its high cash flow generating business model and low capital expenditures are likely to help sustain share buybacks, going forward.
- ▲ Credit Acceptance's trailing 12-month return on equity (ROE) reflects its superiority in terms of utilizing shareholders' funds. The company's ROE of 30.64% compares favorably with 17.49% for the industry.
- ▲ Shares of Credit Acceptance have underperformed the industry so far this year. However, the company's earnings estimates for 2020 have been revised 7.5% upward over the past 30 days. Given the strong fundamentals and positive estimate revisions, the stock has upside potential.

Growth in revenues, primarily driven by increase in consumer loans along with a rise in dealer enrollments, remains a positive for Credit Acceptance. Its share buyback policy seems impressive.

Reasons To Sell:

- ▼ Credit Acceptance has been witnessing a continuous increase in expenses over the past several years. Operating expenses have increased at a CAGR of 13.9% over the last six years (2014-2019). The increase has been mainly due to a rise in salaries and wages, and sales and marketing expenses. While operating expenses declined in the first half of 2020, the same is expected to remain elevated in the near term due to the company's continued efforts to hire additional team members and sales force.
- ▼ Credit Acceptance's asset quality has been deteriorating over the past few years. While provision for credit losses declined in 2018, the same witnessed a six-year (2014-2019) CAGR of 42.9%. Moreover, in the first six months of 2020, provisions increased significantly, owing to the coronavirus-related concerns. Given the rise in loan balances and the continued uncertainty related to the impact of the virus, provisions are expected to remain elevated in the near-term.
- ▼ As of Jun 30, 2020, Credit Acceptance had total debt worth \$4.80 billion, significantly higher than the cash and cash equivalents balance (including restricted cash and restricted securities) of \$459.1 million. Notably, in September, Moody's affirmed the company's ratings and outlook as stable. The company's times-interest-earned ratio of 3.2 for second-quarter 2020 declined sequentially. In fact, the ratio has been witnessing a declining trend over the past several quarters. Thus, given the company's significantly high debt burden, its current liquidity position might not be sufficient to meet debt obligations in the future if the economic situation worsens.
- ▼ Also, Credit Acceptance seems overvalued when compared with the broader industry. Its current price-to-book and price-to-earnings (F1) ratios are higher than the respective industry averages.

Continuously increasing operating expenses and deteriorating credit quality remain major concerns for Credit Acceptance. Its high levels of debt will likely hurt growth and hence make us apprehensive.

Last Earnings Report

Credit Acceptance Q2 Earnings Beat, Provisions Rise

Credit Acceptance reported second-quarter 2020 earnings of \$5.40 per share, beating the Zacks Consensus Estimate of \$4.65. The company recorded earnings of \$8.68 per share in the prior-year quarter. Notably, the figure includes certain non-recurring items.

Increase in revenues and lower operating expenses supported results. Moreover, the balance sheet remained strong during the second quarter. However, a significant increase in provisions remained a major headwind.

Excluding non-recurring items, net income (non-GAAP basis) was \$154.1 million or \$8.63 per share, down from \$162.9 million or \$8.60 per share in the prior-year quarter.

GAAP Revenues Increase, Expenses Fall

Total revenues were \$406.3 million, up 9.6% year over year. The increase was largely driven by a rise in finance charges. Also, the figure beat the Zacks Consensus Estimate of \$372.7 million.

Operating expenses of \$81.6 million declined slightly from the prior-year quarter. Lower general and administrative attributed to the fall.

As of Jun 30, 2020, net loans receivable amounted to \$6.7 billion, up 2% from the prior quarter. Total assets were \$7.3 billion as of the same date, which increased 1.1% sequentially. Also, total stockholders' equity was \$2 billion, up 5% from the prior quarter.

Credit Quality Deteriorates

Provision for credit losses surged substantially from the year-ago quarter to \$139.4 million. The rise was mainly due to the adoption of CECL on Jan 1, 2020, and the impact of a reduction in expected future cash flows from its loan portfolio.

Allowance for credit losses at the second-quarter end was \$3.4 billion, up significantly year over year.

Quarter Ending	06/2020
Report Date	Jul 30, 2020
Sales Surprise	9.01%
EPS Surprise	16.13%
Quarterly EPS	5.40
Annual EPS (TTM)	18.12

Recent News

Credit Acceptance's Ratings and Outlook Affirmed by Moody's - Sep 15, 2020

Credit Acceptance's corporate family and long-term senior unsecured ratings have been affirmed at Ba3 by Moody's Investors Service. Moreover, the rating outlook is stable for the company.

Reasons Behind Affirmation

The affirmations are reflective of the company's strength in profitability, decent capitalization levels and liquidity position. However, Moody's believes the company's profitability might be strained in the upcoming quarters due to the pandemic-induced uncertain economic environment and elevated regulatory risk in subprime auto lending.

Credit Acceptance displays a solid capital position, with tangible equity to tangible managed assets of 28% as of Jun 30, 2020. Moody's expects the company to maintain a strong capitalization over the next 12-18 months. Also, the company has adequate liquidity with more than \$800 million available under its revolver and warehouse facilities as of Jun 30, 2020.

However, the pandemic-induced economic uncertainties are major headwinds for the company. Notably, Credit Acceptance revised the expected loan portfolio cash flows by about \$200 million in the first quarter of 2020. Further, it continues to be plagued with legal problems with subpoenas received from the New Jersey and Maryland Attorneys General, and a lawsuit filed by the Massachusetts Attorney General.

Also, the company's profitability declined in the first half of 2020 from the prior-year period. This mainly resulted from the CECL introduction and the overall grim economic situation. Further, loan originations plummeted in March and April due to the lockdown measures imposed. However, the same witnessed improvement in the following months as lockdown measures were eased.

What can Trigger a Change in Moody's Ratings?

Credit Acceptance's ratings will likely be upgraded if the company maintains its robust position in the subprime auto lending market and shows stable asset quality. Further, increasing profitability levels and low debt to equity ratios will aid the firm.

However, the ratings could be downgraded if the profitability declines and asset quality deteriorates. Moreover, rise in debt to equity levels and fall in the share of senior unsecured debt can result in a downgrade too.

Credit Acceptance Sued for Deceptive Auto-Lending Practices - Aug 31, 2020

A lawsuit has been filed against Credit Acceptance in Suffolk Superior Court. Attorney general, Maura Healey, alleged that Credit Acceptance made unfair and deceptive auto loans to thousands of consumers in Massachusetts, provided investors with false or misleading information regarding auto securities they offered, and engaged in unfair debt-collection practices.

AG Healey stated, "This company made unaffordable and illegal loans to borrowers, causing them to fall into thousands of dollars of debt and even lose their vehicles. We are taking a close look at this industry and we will not allow companies to profit by violating our laws and exploiting consumers."

Per this lawsuit, since 2013, Credit Acceptance failed to inform investors that the pools of loans that were packaged and securitized were topped off with higher-risk loans despite claiming otherwise to investors.

Moreover, as a violation of state law, the company made high-interest subprime auto loans to Massachusetts borrowers which it knew that they would not be able to repay.

Because of this, borrowers had to experience ruined credit. They lost vehicles and down payments, and were left with an average debt of \$9,000. Also, borrowers were subject to hidden finance charges because of which the company's loans exceeded the usury rate ceiling of 21%.

Credit Acceptance is also said to have taken excessive and illegal measures to collect debt from defaulted borrowers, which included sending faulty notices to borrowers with repossessed vehicles, harassing consumers with unlawfully repetitious collections calls, and overcharging consumers on their deficiencies.

Now, the state is seeking relief for borrowers as well as civil penalties.

Notably, an industry-wide investigation is ongoing to review securitization practices in the subprime auto market.

Valuation

Credit Acceptance's shares are down 29.2% in the year-to-date period and 28.6% over the trailing 12-month period. Stocks in the Zacks sub-

industry and the Zacks Finance sector are down 23.5% and 19.2%, respectively, in the year-to-date period. Over the past year, the Zacks sub-industry and the sector are down 21.4% and 15.6%, respectively.

The S&P 500 index is up 1.4% in the year-to-date period and 7.3% in the past year.

The stock is currently trading at 15.28X forward 12 months earnings, which compares to 7.91X for the Zacks sub-industry, 15.00X for the Zacks sector and 20.94X for the S&P 500 index.

Over the past five years, the stock has traded as high as 24.55X and as low as 8.76X, with a 5-year median of 12.79X. Our Neutral recommendation indicates that the stock will perform in line with the market. Our \$329 price target reflects 16.04X forward earnings.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	B
Momentum Score	B
VGM Score	B

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
