Growth: D

Momentum: C

Summary

Shares of Chubb have underperformed its industry year to date. The company anticipates revenue and earnings in the short term to be affected by the impact of the COVID-19 pandemic. Exposure to catastrophe loss remains a concern as it induces volatility in underwriting profitability. Elevated expenses weigh on operating income. However, Chubb benefits from a suite of compelling products as well as services. Its inorganic growth story helps it to achieve a higher long-term return on equity. It boasts a strong capital position, with sufficient cash generation capabilities. Strong capital position helps it boost shareholders' value through share repurchases and dividend payouts and invest in strategic growth initiatives that pave the way for long-term growth. Chubb is focusing to capitalize on the potential of middle-market businesses.

Overview

Chubb Limited was formerly known as ACE Limited. ACE Limited after acquiring The Chubb Corp in Jan 2016 assumed the name of Chubb. Headquartered in Zurich, Switzerland, the company boasts being one of the world's largest providers of property and casualty (P&C) insurance and reinsurance and largest publicly traded P&C insurer, based on market capitalization of \$56.9 billion. Chubb has diversified through acquisitions into many specialty lines, including marine, medical risk, excess property, environmental and terrorism insurance and has local operations in 54 countries and territories. Chubb provides specialized insurance products such as personal accident, supplemental health and life insurance to individuals in select countries. Its reinsurance operations include both P&C and life companies.

Chubb presently operates through following six segments: **North America Commercial P&C Insurance (40% of 2019 written premiums)** segment offers a broad range of retail, and wholesale and specialty products. **Overseas General (29%)** segment provides property, primary and excess casualty, energy, professional risk, marine, political risk, trade risk, accident and health, aviation, and consumer-driven products. **North America Personal P&C Insurance (15%)** includes the business written by Chubb Personal Risk Services division comprising Chubb high net worth personal lines business and ACE Private Risk Services. **Life (8%)** segment offers traditional life reinsurance and life insurance products in Thailand, Vietnam, the United Arab Emirates, Taiwan, China, Egypt, among others. **North America Agriculture (6%)** segment offers coverage for agriculture business. These include Multiple Peril Crop Insurance crop-hail and farm P&C insurance protection to U.S. and Canadian customers by means of Rain and Hail Insurance Service Inc. (Rain and Hail). **Global Reinsurance (2%)** segment offers a broad range of reinsurance products to several P&C insurers.

Source: Zacks Investment Research

Reasons To Sell:

- ▼ Shares of Chubb have lost 26.6% year to date, wider than the industry's decline of 10.5% over the same time frame. Exposure to cat loss and rising expenses should continue to weigh on shares.
- ▼ Chubb has substantial exposure to loss from natural disasters, man-made catastrophes and other catastrophic events, which have been inducing volatility in its underwriting results over a considerable period of time and lowering combined ratio. Chubb incurred catastrophe loss of \$1.5 billion in the second quarter, up 583.3% year over year, attributable to COVID-19 , severe weather-related events in the United States, as well as civil unrest-related losses in the country. This resulted in underwriting loss of \$929 million against the year-ago underwriting income of \$727 million, with combined ratio deteriorating 2220 basis points. Chubb estimates the COVID 19 pandemic and its impact on economic growth to weigh on its operating income and revenues in the near term.
- ▼ After witnessing substantial improvement in net investment income over the last few years, the same fell 0.4% in the first half of 2020, owing to lower reinvestment rates on new and reinvested assets, lower rates on floating rate obligations, and adverse foreign exchange. Given a low rate environment, Chubb expects net investment income to remain under pressure in the near term. The company estimates adjusted net investment income run rate to be in the range of \$850 million to \$860 million, down from the earlier guidance of \$885 million to \$890 million.
- ▼ Chubb has been witnessing a noticeable increase in expenses, primarily due to higher loss and loss expenses, policy acquisition costs, administrative expenses and policy benefits over the last few years (with the exception of 2015). Total expenses increased 20.2% in the first half of 2020. Higher expenses weighed on the company's margins. Net margin contracted 130 bps in the first quarter followed by another 490 bps in the second quarter of 2020. The company estimates increase in insurance claims from COVID 19 pandemic to weigh on operating income.

Chubb's exposure to cat loss inducing underwriting volatility, escalating expenses weighing on margin expansion and muted investment income remain concerns.

Risks

- Chubb has always considered acquisition as an effective strategy for inorganic growth and global expansion. Acquisitions provide the company with a competitive edge in terms of scale, efficiencies and balance sheet size, which would lead to considerable value creation in the future. Through acquisitions, Chubb has expanded its international and domestic footprint along with building a superior portfolio of products and services. Acquisitions have improved premium writings in the recent times and helped the company deliver better numbers, which we expect will continue.
- Apart from focusing on inorganic growth, Chubb made investments in various strategic initiatives that paved the way for long-term growth. The company is focusing on cyber insurance that has immense room for growth. Also, it has been putting in efforts to capitalize on the potential of middle-market businesses, both domestic and international, with traditional core package as well as specialty product. It believes Accident & Health and Personal Lines businesses are well poised for growth. The company's U.S. small commercial business has gained momentum and it expects this business to have an annual run rate of premium that can be in the multi-billion dollar range in the next three to five years. Further, Chubb's several distribution agreements have expanded its network, thus boosting its market presence.

We expect growth momentum to continue with improved rate environment and increase in exposure and market share.

- Chubb boasts a strong capital position, with sufficient cash generation capabilities. It had operating cash flow of \$3.7 billion in the first half of 2020, up 37% year over year. The company's debt has been increasing since 2017. At the end of the second quarter of 2020, debt to capital was 23%, up from 22.7% at the end of 2019. Also, long-term debt to capital of 20.3% compares unfavorably with the industry's measure of 1.3%.

Nonetheless, the firm's times interest earned ratio has been improving over the years. The improvement in this ratio indicates that the firm will be able to meet current obligations in the near future without any difficulties. At a time when every entity is looking forward to preserve liquidity amid uncertainty as a result of the COVID-19 outbreak, an improving ratio is reassuring for investors. The company enjoys strong credit ratings from credit rating agencies. Also the company had short-term debt amounting to \$1.3 million as of Jun 30, 2020 and cash and cash equivalents came of \$1.6 billion as of Jun 30, 2020. This suggests that the company has sufficient cash reserves to meet its short-term debt obligations.

- The strong capital and liquidity position enable Chubb to enhance its shareholder value via share buyback and dividend payouts. In May 2020, the company increased its annual dividend by 4%, which marked the 27th straight year of dividend hike. Notably, Chubb has more than doubled its quarterly dividend since 2010. The company's current dividend yield is 2.6%, better than the industry average of 0.5%, which makes the stock an attractive pick for yield seeking investors.

Though the company returned \$1.019 billion to shareholders in the first half of 2020, it decided to stall share repurchase activity amid this pandemic to reserve capital for both risk and opportunity.

Last Earnings Report

Chubb Q2 Earnings Surpass Estimates, Premiums Up Y/Y

Chubb reported second-quarter 2020 core operating loss of 56 cents per share, which is narrower than the Zacks Consensus Estimate of a loss of 66 cents per share. Notably, the company had reported core operating income of \$2.60 per share in the prior-year quarter.

An after-tax charge related to the COVID-19 pandemic of \$1.2 billion adversely impacted the quarterly results.

Quarter Ending	06/2020
Report Date	Jul 28, 2020
Sales Surprise	-1.87%
EPS Surprise	15.15%
Quarterly EPS	-0.56
Annual EPS (TTM)	7.10

Quarter in Detail

Net premiums written inched up 0.1% year over year to nearly \$8.4 billion in the quarter. Net premiums earned rose 3% year over year to \$8.1 billion. The upside can primarily be attributed to rate increases in the company's North America and international operations. However, growth in premiums has been partially offset by the pandemic, which impacted the company's consumer business including accident and health, and travel and personal lines.

Net investment income was \$827 million, down 3.7% year over year.

Property and casualty (P&C) reported underwriting loss of \$929 million, against the year-ago underwriting income of \$727 million. Global P&C underwriting loss excluding Agriculture was \$960 million, which compares unfavorably with the year-ago underwriting income of \$689 million.

Chubb incurred after-tax catastrophe loss of \$1.5 billion in the second quarter, soaring 583.3% year over year.

Segmental Update

North America Commercial P&C Insurance: Net premiums written increased 5.3% year over year to \$3.7 billion. Combined ratio deteriorated 3080 basis points (bps) to 117.3%.

North America Personal P&C Insurance: Net premiums written climbed 1.4% year over year to \$1.3 billion. Combined ratio improved 150 bps to 88.8%.

North America Agricultural Insurance: Net premiums written declined 1.1% from the year-ago quarter to \$461 million. Combined ratio deteriorated 170 bps to 91.8%.

Overseas General Insurance: Net premiums written of \$2.02 billion declined 10.5% year over year. The downside is primarily due to the negative impact of the pandemic on particular P&C personal lines coverages and A&H and travel insurance. Combined ratio deteriorated 1630 bps to 107.1%.

Global Reinsurance: Net premiums written advanced 4.6% from the year-ago quarter to \$207 million, primarily due to positive rate increases and new business written. Combined ratio improved 1110 bps to 76.6%.

Life Insurance: Net premiums written were up 7% year over year to \$619 million.

Financial Update

Cash balance of \$1.6 billion as of Jun 30, 2020 inched up 1.3% from the 2019-end level.

Total shareholders' equity decreased 1% from the level at 2019 end to \$54.8 billion as of Jun 30, 2020.

As of Jun 30, 2020, book value per share of \$121.32 was down 0.9% from the figure as of Dec 31, 2019.

Operating cash flow was nearly \$2 billion.

Recent News

Chubb's Unit Offers 1.375% \$1 Billion Senior Notes - Sep 14, 2020

Chubb Limited announced that its subsidiary Chubb INA Holdings has priced \$1 billion senior notes. The notes carry an interest rate of 1.375% and are scheduled to mature in 2030. The notes are guaranteed by Chubb Limited.

The company plans to deploy the net proceeds along with available cash to repay at maturity \$1 billion 2.875% senior notes that are due on Nov 3, 2022.

Chubb Declares Quarterly Dividend — Aug 12, 2020

The board of directors of Chubb Limited declared a quarterly dividend of 78 cents per share. The dividend will be paid out on Oct 9 to shareholders of record as of Sep 18.

Valuation

Chubb shares are down nearly 26.6% in the year-to-date period and 27.9% over the trailing 12-month period. Stocks in the Zacks sub-industry and the Zacks Finance sector are down 10.5% and 18.3% in the year-to-date period, respectively. Over the past year, the Zacks sub-industry and sector are down 4.7% and 11.1%, respectively.

The S&P 500 index are up nearly 4.1% in the year-to-date period and 14.2% in the past year.

The stock is currently trading at 0.94x trailing 12-month book value, which compares to 1.28x for the Zacks sub-industry, 2.44x for the Zacks sector and 5.77x for the S&P 500 index.

Over the past five years, the stock has traded as high as 1.43x and as low as 0.77x, with a 5-year median of 1.26x. Our Underperform recommendation indicates that the stock will perform worse than the market. Our \$97 price target reflects 0.8x book value.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	D
Momentum Score	C
VGM Score	C

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Investing involves risk; principal loss is possible. There is no guarantee that companies that can issue dividends will declare, continue to pay or increase dividends.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
