Summary

Shares of Colgate have outpaced the industry year to date. The stock got a boost from the better-than-expected second-quarter 2020 results, wherein both the top and the bottom line rose year over year. Notably, this was the third straight quarter of sales beat. Strong volume growth, robust price increases and sturdy organic sales boosted the quarterly results. It experienced organic sales growth across all regions, except Europe. Notably, the company's recent buyout of Hello, in a bid to expand its already strong oral care portfolio, is performing well. Moreover, solid e-commerce growth and strong financial position bode well. However, deleverage in advertising and SG&A expenses and adverse currency fluctuations remain concerns. Management expects adverse currency rates to hurt net sales by mid-single digits in 2020.

Overview

Colgate-Palmolive Company's business strategy closely defines efforts to increase its leadership in key product categories through innovation in core businesses, tracking adjacent categories growth and expansion into new markets and channels. Due to the shift of consumer preference to organic and natural ingredients, the company is expanding its Naturals range, including Naturals toothpaste. The company's recent buyout of Hello Products LLC, in a bid to expand its already strong oral care portfolio, is performing well. It is ranked as a leading consumer goods company with global household penetration of 61.6%.

Colgate-Palmolive generated \$15.7 billion in revenues in 2019 and earnings of around \$2.4 billion. Sales contributions for 2019 included 46% from Oral Care, 20% from Personal Care, 18% from Home Care and 16% from Pet Nutrition businesses. It has a market share of 41.1% in the global toothpaste market and 31.6% in the manual toothbrush market. New York City-based Colgate-Palmolive is a global leader in the oral care hygiene market. It produces and distributions household, healthcare and personal care products. The company sells its products in more than 200 countries around the world. Its business is tightly focused on four core categories including – Oral Care, Personal Care, Pet Nutrition and Home Care. Colgate-Palmolive operates through two business segments: (1) Oral, Personal and Home Care; and (2) Pet Nutrition.

Oral, Personal and Home Care: The company's portfolio of Oral, Personal and Home Care products include toothpaste, toothbrushes, mouthwash, bar and liquid hand soaps, shower gels, shampoos, conditioners, deodorants and antiperspirants, skin health products, dishwashing detergents, fabric conditioners, household cleaners and other similar items. The segment is managed geographically in five reportable operating segments: North America, Latin America, Europe, Asia Pacific and Africa/Eurasia. The Oral, Personal and Home Care products contributed nearly 83.9% to total sales in 2019.

Pet Nutrition: The pet nutrition segment consists of pet food products for dogs and cats manufactured by Colgate-Palmolive's subsidiary, Hill's Pet Nutrition. These products are marketed under two brands - Hill's Science Diet and Hill's Prescription Diet. It contributed nearly 16.1% to tot

Source: Zacks Investment Research

Reasons To Buy:

▲ **Robust Q2 Results:** Shares of Colgate have gained 12.8% year to date outperforming the industry's growth of 10.5%. The company posted second-quarter 2020 results, wherein earnings and sales beat the Zacks Consensus Estimate and have improved year over year. In the reported quarter, gains from strong volume growth and robust pricing were offset by unfavorable foreign currency. Total net sales of \$3,897 million improved 1% from the year-ago period driven by strong demand for some categories like liquid hand soap, dish liquid, bar soap and cleaners across almost all geographies. On an organic basis, the company's sales advanced 5.5%. Organic sales were aided by improved volume and higher pricing. This marked the seventh consecutive quarter of sequential improvement in organic sales. On a geographic basis, it experienced organic sales growth across all of its regions, except Europe.

Strong volume growth and robust pricing boosted Colgate's Q2 results. This marked the seventh consecutive quarter of sequential improvement in organic sales.

▲ **Gross Margin Returns to Growth:** Colgate has been witnessing gross margin expansion for the past three quarters. Adjusted gross profit margin of 60.8% increased 120 basis points (bps) from the prior-year quarter. In dollar terms, adjusted gross profit rose 2.6% to \$2,369 million. The uptick can be attributable to improved pricing which contributed to gross margins by 130 basis points somewhat offsetting headwinds from raw materials to the tune of 320 basis points. Notably, the company's commitment toward pricing efforts through premiumization and revenue growth management has been paying off. This has resulted in organic sales growth and gross margin expansion. Moreover, its funding-the-growth endeavors remain impressive.

▲ **Innovation to Aid Business Growth:** Innovation and in-store implementation have been the guiding principles for Colgate's growth strategy over the years. The company's innovation strategy is focused on growing in adjacent categories and product segments. Further, it is focused on the premiumization of its Oral Care portfolio through major innovations. The company's recent buyout of Hello Products LLC (a leading oral care brand in the United States that produces eco-friendly and organic products), in a bid to expand its already strong oral care portfolio, is performing well. The brand's products, which have a distinct position in the market, are extremely popular with young consumers and across the broader segment. Further, the brand fully complements the company's Tom's of Maine and Colgate brands.

Also, the company's innovation efforts were highlighted by the re-launch of Colgate Total and Hill's Science Diet as well as the continued expansion of the Naturals and Therapeutics divisions. This, along with accelerated investments in brands and higher pricing, is likely to aid the top line. Additionally, it continues to expand the Naturals toothpaste and prescription diet. In fact, the Naturals range is a key area of focus for the company in personal and home care categories.

▲ **Expanding in New Channels and Markets:** Expanding the availability of its products, through enhanced distribution to newer markets and channels, is one of Colgate's priorities to improve organic sales performance. The company is aggressively expanding into faster growth channels while extending the geographic footprint of its brands. In 2019, the company expanded its portfolio by introducing pharmacy brands like elmex and meridol to newer markets. Moreover, it remains impressed with the performance of professional skincare businesses — Elta MD and PCA Skin — in spas and dermatologists. Further, the company expanded its premium skincare portfolio with the buyout of Filorga skincare business. It is also keen on expanding the availability of its products through the e-commerce channel. Speaking of e-commerce, the company has increased its focus on this platform as more and more consumers are using online services for their essential needs, given the COVID-19 outbreak. This led the e-commerce business to grow more than 50% in the second quarter backed by solid online show in Hill's and U.S. businesses. Also, following the launch of Optic White Renewal, it witnessed robust market share gains in toothpaste across the United States during quarter under review. We note that the company has been expanding the availability of its products through the e-commerce offerings with the launch of Hill's to home, which enables pet parents to purchase prescription diet products directly from their veterinarian with home delivery option. All these actions are likely to fuel sales.

▲ **Financial Flexibility:** Colgate enjoys strong financial status. Colgate ended the quarter with total debt of \$7,392 million, which was down 5.8% from the prior-quarter. Moreover, the company's debt-times interest earned ratio of 26 has improved from 25 in the prior-quarter. The times-interest-earned ratio is very important for some companies, as it measures a company's ability to meet its debt obligations based on its current income.

▲ **Sustained Shareholder Returns:** Colgate follows a disciplined capital allocation strategy that focuses on making investments to develop business while using the excess cash to enhance shareholder returns through dividend payouts and share buybacks. The company has been regularly increasing its dividend every year since 2001. In second-quarter 2020, the company paid out dividends of \$411 million. Earlier, management increased its quarterly cash dividend from 43 cents per share to 44 cents, payable on May 15. Notably, Colgate has a dividend payout ratio of 59.7%, annualized dividend yield of 2.3% and free cash flow yield of 5.3%. With an annual free cash flow return on investment of 39.32%, ahead of the industry's nearly 22.57%; the dividend payment is likely to be sustainable.

Reasons To Sell:

- ▼ **Stock Looks Overvalued:** Considering the price-to-earnings (P/E) ratio, Colgate looks pretty overvalued compared with the industry and the S&P 500. The stock has a trailing 12-month P/E ratio of 26.51x, which is above the median level of 24.8x and below the high level of 27.33x scaled in the past year. On the contrary, the trailing 12-month P/E ratio is 21.09x for the industry and 23.72x for the S&P 500. Given these factors, we believe that the stock is quite stretched from the P/E aspect.
- ▼ **Higher SG&A Expenses:** Colgate is grappling with higher selling, general & administrative (SG&A) expenses for a while now. During the quarter under review, adjusted SG&A expenses increased 2.6% to \$1,395 million, whereas as a percentage of sales the same deleveraged 60 basis points to 35.8%. This increase in SG&A expenses may be attributed to driven by increased advertising investment and elevated logistics cost stemming from spike in demand due to COVID-19. We believe that any substantial increase in SG&A is likely to show on operating margin.
- ▼ **Currency Headwinds Remain a Hurdle:** Despite pricing gains, Colgate's sales for second-quarter 2020 continued to be hurt by adverse currency rates. Currency had a 6% negative impact on net sales. Moreover, unfavorable currency negatively impacted sales across all geographic regions in the quarter. Currency had negative impacts of 18% in Latin America, 0.5% in North America, 10.5% in Africa/Eurasia, 3.5% in Europe, 2% in Hill's Pet Nutrition and 2.5% in the Asia Pacific. Looking ahead, management continues to expect a mid-single-digit negative impact related to foreign exchange on net sales for 2020, based on current spot rates.
- ▼ **Slowdown of Global Economies:** Colgate remains vulnerable to global economic challenges, which may impact its revenues, profits and cash flows. A global economic slowdown can reduce the personal disposable income of consumers, which in turn, will decrease the company's sales volumes as consumers move toward cheaper alternatives. Further, it may force the company to shift its product mix to lower margin products, thereby impacting margins. In fact, it has been witnessing slower category growth rates worldwide, which remains a threat to the company's profitability.

Colgate is reeling under high costs and adverse currency rates. For 2020, unfavorable currency is expected to negatively impact to the tune of mid-single-digit.

Last Earnings Report

Colgate's Q2 Earnings & Sales Beat Estimates

Colgate has reported second-quarter 2020 results, wherein earnings and sales beat the Zacks Consensus Estimate and have improved year over year. In the reported quarter, gains from strong volume growth and robust pricing were offset by unfavorable foreign currency. Citing continued uncertainty regarding the coronavirus pandemic, the company withheld its view for 2020.

However, it continues to expect a mid-single-digit negative impact related to foreign exchange on net sales for 2020, based on current spot rates.

Adjusted earnings of 74 cents per share rose 3% from the prior-year quarter and surpassed the Zacks Consensus Estimate of 71 cents. On a GAAP basis too, earnings were 74 cents per share, reflecting growth of 9% from 68 cents earned in the year-ago period.

Total net sales of \$3,897 million improved 1% from the year-ago period and beat the Zacks Consensus Estimate of \$3,800 million. On an organic basis, the company's sales advanced 5.5%. Organic sales were aided by improved volume and higher pricing. Unit volume increased 3.5% and 2% on an organic basis. Further, pricing was up 3.5%. Growth was mainly led by strength in North America and Hill's segments. However, results were partly hurt by a 6% negative impact from foreign currency.

During the quarter, the company witnessed strong demand for some categories like liquid hand soap, dish liquid, bar soap and cleaners across almost all geographies. However, it witnessed the impacts of consumers' lowering their pantry inventories for other categories, particularly in Europe.

Adjusted gross profit margin of 60.8% increased 120 basis points (bps) from the prior-year quarter. In dollar terms, adjusted gross profit rose 2.6% to \$2,369 million.

Colgate's market share of manual toothbrushes reached 31% year to date. Further, the company continued with its leadership position in the global toothpaste market, with market share at 40%.

Segmental Discussion

North America's net sales (24% of total sales) improved 12%, reflecting a 13% rise in unit volume, offset by a 0.5% decline in pricing and a 0.5% negative currency impact. On an organic basis, sales grew 11% with volume up 11.5%, driven by growth in the United States and Canada.

Latin America's net sales (21% of total sales) dropped 13.5% year over year as 9% gains in pricing were offset by a 4.5% decline in unit volume and an 18% negative currency impact. On an organic basis, sales were up 4.5%, led by growth in Argentina, Brazil, the Caribbean region and Colombia, partially negated by a decline in Mexico. Organic volume also decline 4.5% in the quarter.

Europe's net sales (16% of total sales) increased 5% year over year on a 7.5% rise in unit volume, somewhat offset by flat pricing and 2.5% adverse impact of unfavorable currency exchange. However, organic sales in Europe were down 1.5%, driven by a 1.5% decline in organic volume as well as declines in the U.K., Germany and Spain. This was slightly offset by organic sales growth in Switzerland and Belgium.

The **Asia Pacific** segment's net sales (16% of total sales) declined 3%, attributable to a 3% fall in unit volume and a 3.5% impact of unfavorable currency rates, offset by 3.5% pricing gains. On an organic basis, sales for the Asia Pacific were up 0.5%, mainly driven by growth in Greater China and Australia, partly compensated by declines in Thailand and India.

Africa/Eurasia's net sales (6% of total sales) dropped 6% year over year, owing to a 10.5% adverse impact from foreign exchange, which more than offset the 0.5% increase in unit volume and 4% pricing gains. Organic sales for Africa/Eurasia improved 2.5%, driven by gains in Turkey, the Saudi Arabia/Gulf States region and South Africa. Organic volume in the region declined 1.5%.

Hill's Pet Nutrition's net sales (17% of total sales) grew 9.5% from the year-ago quarter. Results gained from a 7.5% increase in unit volume and a 4% rise in pricing, offset by a 2% negative impact of currency. On an organic basis, sales were up 11.5%, aided by gains in the United States and Europe.

Other Financial Details

Colgate ended second-quarter 2020 with cash and cash equivalents of \$997 million, and total debt of \$7,392 million. Net cash provided by operating activities amounted to \$1,794 million as of Jun 30, 2020.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	A
Momentum Score	B
VGM Score	B

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
