Summary

Shares of Fifth Third have outperformed the industry in the past three months. It also has a decent earnings surprise history, with its earnings outpacing the Zacks Consensus Estimate in three of the trailing four quarters while missing in the other. Rising loans and deposit balances, and improving asset quality are likely to keep supporting the company's financials in the upcoming quarters. Furthermore, with support from a solid liquidity position, the bank is less exposed to credit risk in case of any economic downturn. Fifth Third's capital-deployment activities seem sustainable due to its strong balance-sheet position. However, rising expenses due to investments in branch digitization initiatives and margin pressure amid near-zero interest rates remain major concerns. Also, significant exposure to commercial loans acts as a headwind.

Overview

With assets of \$206.9 billion, Cincinnati-based Fifth Third Bancorp has 1,098 full-service banking centers in 10 states throughout the Midwestern and Southeastern regions of the United States. In September 2019, Fifth Third received the Office of the Comptroller of the Currency's approval to convert from an Ohio state-chartered bank to a national bank.

Fifth Third classifies its operations into mainly four reportable segments. Firstly, Branch Banking provides deposit, loan and lease products, and credit cards to individuals and small businesses. Next, Consumer Lending includes mortgage and home equity lending, as well as other indirect lending activities.

Also, the company has a Commercial Banking unit, that provides financial services and products to large and middle-market businesses, governments and professional customers. The Wealth and Asset Management division offers investment alternatives to individuals, companies and non-profit organizations. These consist of proprietary mutual funds, securities brokerage and asset management services.

Lastly, Other segment includes unallocated portion of investment securities portfolio, securities gains and losses, non-core deposit funding, unassigned equity, provision expense above net charge-offs or benefit from reduction of allowance for loan losses, representation and warranty expense above actual losses or benefit from reduction of representation and warranty reserves, payment of preferred stock dividends and additional activities.

In January 2021, Fifth Third acquired Hammond Hanlon Camp LLC. In 2019, the company completed the acquisition of MB Financial. In 2018, it acquired Coker Capital, a healthcare Merger & Acquisition advisory firm. In 2017, it acquired R.G. McGraw Insurance Agency.

Notably, Fifth Third has exited its entire stake in all publicly-traded companies. In March 2019, the company exchanged its remaining shares of Worldpay Holdings, LLC for shares of Worldpay, Inc., and subsequently sold its shares, recording a gain of \$562 million. During March and April 2019, Fifth Third exchanged its Class B units of GreenSky Holdings, LLC for Class A common stock of GreenSky, Inc., and subsequently sold all of the stock.

Reasons To Buy:

- ▲ Fifth Third's diverse revenue base will likely support its earnings growth. The company has expanded its non-interest income base over the years with help of strategic investments through North Star initiatives and MB Financial's buyout, which are expected to result in revenue growth, expense savings and operational excellence. Particularly, the company anticipates an annual pre-tax income benefit of \$60-\$75 million by 2022. Also, the transaction is likely to reduce expenses by \$255 million. Additionally, the company remains focused on executing other measures, including branch consolidation.
- ▲ The company's deposit balances represent an important source of funding and revenue growth opportunity. Fifth Third continues to focus on core deposit growth in its retail and commercial franchises by improving customer satisfaction, building full relationships and offering competitive rates. Notably, Fifth Third's total deposits, and loans and leases recorded a compound annual growth rate (CAGR) of 11.3% and 4.3%, respectively, over the last five years ending 2020. Total portfolio loans and leases witnessed a decreasing trend in the first quarter, while total deposits saw an increasing trend. We believe the company is well positioned to strengthen its organic growth as the U.S. economy is gaining traction.
- ▲ Fifth Third's capital-deployment activities are impressive. The company raised its quarterly common stock dividend by 12.5% in February 2020. Also, the company announced a share buyback program of up to 100 million shares in June 2019, with no expiration date, that was suspended mid-March following the coronavirus crisis. Nonetheless, following the Federal Reserve's approval to buy back shares beginning first-quarter 2021, the company repurchased shares worth \$180 million during the quarter and has authorized \$347 million for the second quarter. Fifth Third's capital-deployment activities seem sustainable due to its improving earnings performance over the past few quarters and strong balance-sheet position.
- ▲ Fifth Third has a strong balance sheet. As of Mar 31, 2021, the company had debt of \$16.2 billion, which has reduced over the past few quarters. Cash and cash equivalents stood at \$3.12 billion as of the same date. Further, its first-quarter 2021 times interest earned ratio of 6.9 has increased over the past few quarters, with some volatility. Therefore, with a decent cash position, we believe Fifth Third has lesser likelihood of default of interest and debt repayments in the near term even if the economic situation worsens.
- ▲ Proactive steps have been taken by Fifth Third to improve its credit quality. In the last few years, the company took aggressive actions to reduce credit risk. Further, in line with its strategy to reduce volatility, particularly given the current environment, the company shrank exposures in certain segments such as commodity trading. Going forward, we expect the overall improvement in the credit metrics trend might continue given the expected economic recovery.
- ▲ Fifth Third's trailing 12-month return on equity (ROE) fortifies its growth potential. The company's ROE of 10.84% compares favorably with 10.65% for the industry. This reflects that the company is more efficient in using shareholders' funds.
- ▲ Shares of Fifth Third have outperformed the industry over the past three months. Further, the company's earnings estimates for the current year have been revised marginally upward over the past seven days. Also, the stock seems undervalued when compared with the broader industry. Its current price-cash flow is in-line with the industry average and price-earnings (F1) ratio is below the industry average. Therefore, given the progress on fundamentals and positive estimate revisions, the stock has upside potential left.

Fifth Third's diversified revenue sources along with growing deposit and loan base keep it well poised to undertake inorganic growth strategies. Also, improving credit quality is a tailwind.

Reasons To Sell:

- ▼ Elevated non-interest expenses, despite efficiency initiatives, remain a major concern for Fifth Third. Initiatives such as branch digitization keep the company's expense base under pressure in the short term. Also, given its ongoing strategic investments in several areas including technology, expenses might escalate in the near-term. Notably, expenses recorded a five-year CAGR of 6% in 2020, with a trend continuing in the first quarter.
- ▼ Owing to the Federal Reserve's accommodative monetary policy stance and near-zero interest rates, Fifth Third is expected to continue witnessing pressure on net interest margin (NIM). After recording an improving trend over the last several years, NIM shrunk in 2020 and during the first quarter of 2021. The fall was mainly due to impact of excess liquidity and lower interest rates. Besides, the central bank has signaled no rate hike in the near future.
- ▼ The loan portfolio of Fifth Third comprises majorly commercial loans (nearly 64% as of Mar 31, 2021). Such high exposure can be risky for the company signifying concentration risk amid uncertain markets.

Strategic investments in areas such as technology and involvement in legal issues keep non-interest expenses elevated. Also, significant exposure to commercial loans remains a concern for Fifth Third.

Last Earnings Report

Fifth Third Q1 Earnings Beat on Recapture of Provisions

Fifth Third's first-quarter 2021 earnings of 93 cents per share surpassed the Zacks Consensus Estimate of 69 cents. Results also compare favorably with the prior-year quarter's earnings of 13 cents.

The company's performance displays a solid capital position, along with rising revenues, aided by fee income growth. Also, benefit from credit losses was a tailwind. However, marginally higher expenses, and flat loan and deposit growth played spoilsport.

The company reported net income available to common shareholders of \$674 million, up significantly from \$29 million recorded in the prior-year quarter.

Quarter Ending 03/2021

Report Date	Apr 20, 2021
Sales Surprise	1.30%
EPS Surprise	34.78%
Quarterly EPS	0.93
Annual EPS (TTM)	2.96

Non-Interest Income Support Revenues, Costs Flare Up, Loan & Deposits Flat

On a fully-taxable equivalent basis, total revenues came in at \$1.93 billion, up 1.3% year over year, driven by higher fee income. Further, the figure surpassed the Zacks Consensus Estimate of \$1.90 billion.

Fifth Third's net interest income (NII) came in at \$1.18 billion, down 4% year on year. It primarily reflects lower market rates and weak commercial loan balances, partially offset by soft deposit costs, favorable impact of previously-executed cash flow hedges, and interest income from Paycheck Protection Program (PPP) loans.

NIM shrunk 66 basis points (bps), year over year, to 2.62%, representing the impact of excess liquidity, lower market rates, and lower commercial loan balances, partially offset by lower deposit costs.

Non-interest income climbed 3.7% to \$759 million (excluding certain non-recurring items). Including significant items, non-interest income rose 11.7% year over year to \$749 million. Rise in wealth and asset management revenues, card and processing revenues, leasing business revenues and other non-interest revenues were partly muted by lower commercial banking revenues, service charges on deposits and mortgage banking revenues.

Excluding merger-related expenses, non-interest expenses flared up 1.9% from the prior-year quarter to \$1.22 billion. This upsurge chiefly resulted from rise in compensation and benefits expense and non-qualified deferred expenses compared to the year-ago quarter and servicing expense, partially offset by lower other non-interest expense and marketing expense. Including merger expenses, costs rose 1% year over year.

As of Mar 31, 2021, average loan and lease balances, and average total deposits were flat at \$108.9 billion and \$158.8 billion, respectively. An increase in indirect secured consumer loans was offset by a decrease in commercial and industrial loan balances. As for deposits, increases in demand and savings deposits were offset by decreases in interest checking, money market, and other time deposits.

Credit Quality Improve

The company reported benefit from credit losses of \$173 million against provision expense of \$640 million in the year-ago quarter. Net charge-offs came in at \$71 million or 27 bps of average loans and leases on an annualized basis compared with the \$122 million or 44 bps witnessed in the prior-year quarter. Further, total allowance for credit losses decreased 5.4% from the prior-year quarter to \$2.39 billion.

However, total non-performing assets, including loans held for sale, came in at \$783 million, up 10.5% from the year-ago quarter.

Strong Capital Position

As of Mar 31, 2021, Tier 1 risk-based capital ratio was 11.94%, up from 10.56% at the end of the prior-year quarter. The CET1 capital ratio (fully phased-in) was 10.46% compared with 9.37% recorded at the end of the year-ago quarter. The Tier 1 leverage ratio was 8.62% as compared with the year-earlier quarter's 9.37%.

Share Repurchase Update

During the first quarter, the company repurchased shares worth \$180 million.

Outlook

Second-Quarter 2021

These expectations are on sequential basis and includes impact of PPP forecast provided.

The company expects NII to be stable to up 1% and non-interest income to be down 3-5%.

Non-interest expenses are expected to be down in the range of 5-7%.

Average loans and leases are projected to be rise 1-2%.

Net charge offs are likely to be in the range of 25-35 bps.

Full-Year 2021

Management projects average total loans and leases to be stable to up slightly year over year.

NII is expected to be down 1%, while non-interest income is likely to increase 4-5%. Excluding TRA impact, fee income is anticipated to grow 5% to 6%.

Non-interest expenses are expected to rise about 1% (including \$50-\$55 million expected in 2021 servicing expense from recent consumer loan purchases).

Net charge offs are likely to be in the range of 30-40 bps.

Effective tax rate is expected to be between 22% and 23%.

Recent News

Fifth Third Joins Forces With Ceres Company Network – May 11, 2021

Fifth Third's principal subsidiary, Fifth Third Bank, National Association recently announced an alliance with Ceres Company Network. With this move, the company seeks to become part of a network of 60 companies that are focused on attaining sturdy sustainable goals, and offer market-based, just solutions to the biggest challenges on sustainability.

The Ceres Company offers exclusive access for members to its experts, and an ambit of compeers and stakeholders to achieve varied views and counselling in sustainability in this pressing and crucial era. It helps companies handle the world's most pivotal sustainability needs and thrive in the transition to a fair, net zero emissions future.

The CEO and president of Ceres Company noted, "The banking sector has a pivotal role to play in tackling the world's biggest sustainability challenges and accelerating the transition to a more sustainable future. We look forward to working with Fifth Third as it integrates stronger sustainability practices into the bank's strategy and its work with clients."

The latest alliance with Ceres Company follows Fifth Third's success of carbon neutrality for its 2020 operations, which had made the bank the first in its rival group to achieve the threshold. This move also follows the bank's pledge to measure and cut emissions in certain client portfolios, assisted by its joining of the Partnership for Carbon Accounting Financials.

The chairman and CEO of Fifth Third, Greg D. Carmichael, said, "It will be a privilege to work with many of the world's most sustainable companies as we tackle the problems we face, and, together, work to fully realize the potential we have to positively impact our planet and its people."

Fifth Third Concludes Purchase of Hammond Hanlon - Jan 4, 2021

Fifth Third announced that it has completed the acquisition of Hammond Hanlon Camp LLC. The terms of the deal, announced on Dec 2, 2020, have not been disclosed yet.

Hammond Hanlon is one of the leading strategic advisory and investment banking firms with focus on the healthcare industry, specifically the not-for-profit sector. Over the past nine years, the company's core advisory services include mergers, acquisitions and divestitures, partnerships and strategic growth to capital markets and real estate investment banking. The company also has presence in major cities like Atlanta, Chicago, New York and San Diego.

The acquisition, on conclusion, will further fortify Fifth Third's presence in the healthcare industry. The transaction follows the company's buyout of Coker Capital in 2018. It has been particularly focused on expanding its healthcare team for the last 10 years. Consequently, the firm has become one of the foremost platforms for middle-market and corporate clients in the segment.

The acquisition of Hammond Hanlon will also aid Fifth Third's efforts to further enhance its presence in the healthcare segment which is presently becoming one of the fastest growing segments of the economy.

Dividend Update

On Mar 18, 2021, Fifth Third announced a cash dividend of 27 cents per share. The dividend was paid on Apr 15 to shareholders of record as of Mar 31.

Valuation

Fifth Third's shares are up 47.1% in the year-to-date period and 89.0% over the trailing 12-month period. Stocks in the Zacks sub-industry and

Zacks Finance sector are up 30.8% and 19.9%, respectively, in the year-to-date period. Over the past year, the Zacks sub-industry and sector are up 57.3% and 45.6%, respectively.

The S&P 500 Index is up 13.8% and 40.6% in the year-to-date period and trailing 12-month period, respectively.

The stock is currently trading at 12.05X forward 12 months earnings, which compares to 12.18X for the Zacks sub-industry, 16.60X for the Zacks sector and 21.86X for the S&P 500 Index.

Over the past five years, the stock has traded as high as 17.11X and as low as 3.99X, with a 5-year median of 11.88X. Our Neutral recommendation indicates that the stock will perform in line with the market. Our \$43 price target reflects 12.65X forward earnings.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	F
Momentum Score	B
VGM Score	D

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Forward-looking statements are subject to certain risks and uncertainties. Any statements that refer to expectations, projections or characterizations of future events or circumstances, including any underlying assumptions, are forward-looking statements. Actual results, performance, or achievements may differ materially from those expressed or implied.

Returns quoted represent past performance which is no guarantee of future results. Investment returns and principal value will fluctuate so that when shares are redeemed, they may be worth more or less than their original cost. Current performance may be higher or lower than the performance shown.

Investing involves risk; principal loss is possible. There is no guarantee that companies that can issue dividends will declare, continue to pay or increase dividends.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
