Summary

Shares of First Republic have outperformed the industry year to date. Also, the company has an impressive earnings surprise history, having surpassed the Zacks Consensus Estimate in each of the trailing four quarters. The increasing fee income on steady rise in investment management fees will aid revenues. The company's net interest income (NII) has also witnessed sustained growth over the years. The company's balance sheet position also remains solid. Yet, the company's rising operating expenses over the years has been a concern. Further, investment in digital initiatives are likely to keep the expenses elevated in the near term. Moreover, shrinking net interest margins (NIM) due to the Federal Reserve's move to cut interest rates to near zero remains a headwind and is likely to keep margins under pressure in the quarters ahead.

Overview

Headquartered in San Francisco, CA, First Republic Bank is a commercial bank and trust company and a member of the Federal Deposit Insurance Corporation (FDIC). The company specializes in providing personalized, relationship-based preferred banking, preferred business banking, real-estate lending, trust and wealth management services to customers in metropolitan areas across the United States. Notably, the company has been included in the S&P 500 on Jan 2, 2019.

First Republic operates through offices including San Francisco, Palo Alto, Los Angeles and Santa Barbara. It provides wealth management as well as trust services through First Republic Investment Management, Inc. and First Republic Trust Company, respectively. First Republic operates two major business segments:

- The **Commercial Banking** segment (contributed 89% of net income in 2019) accepts funds from customers, originates loans (principally real estate secured mortgage loans) and invests in investment securities. The chief sources of revenues for this segment are – interest earned on loans and investment securities, gains on sales of loans, fees earned from loan and deposit services, and income earned on loans serviced for investors.
- The **Wealth Management** segment (11%) consists of First Republic Investment Management, the money market mutual fund activities through third-party providers and the brokerage activities of First Republic Securities Company, LLC as well as operations of First Republic Trust Company, along with foreign exchange activities.

In December 2016, First Republic Bank acquired Gradifi. Gradifi is a corporate provider of education related benefit plans. Through Gradifi, employers can make direct contributions to education debt repayment or savings plans for their employees.

Source: Zacks Investment Research

Reasons To Buy:

- ▲ First Republic has demonstrated considerable top-line strength over the past few years. The bank's NII, which is also its primary source of income from operations, has exhibited a five-year compound annual growth rate (CAGR) (2015-2019) of 16.2%. In the same time period, its non-interest income reflects growth of 15.4%, with support from steady rise in investment management fees (accounting for 56% of fee income as of Sep 30, 2020). Notably, both continued to show strength in the first nine months of 2020 as well. Such steady growth in both NII and fee income suggests optimism about First Republic's top-line strength.
- ▲ First Republic's balance sheet growth story remains impressive. It recorded notable growth in loan balances, driven by increased loan origination volumes with a five-year CAGR (2015-2019) of 19.8%. Additionally, the company's total deposits have witnessed a CAGR of 17.1% in the same time span. Both metrics improved in the first three quarters of 2020 as well. Though loan demand has been soft due to pandemic concerns, the same is expected to improve once the economy recovers and business activities resume in full swing.
- ▲ As of Sep 30, 2020, the company had total debt worth \$15.3 billion, which reflects a fall over the past few quarters, while its cash and cash equivalents and due from banks improved to \$3.7 billion. Further, time-interest-earned ratio of 4.8 has increased steadily over the past few quarters. Also, its total debt to total capital of 57.4% at the end of the third quarter improved sequentially. Thus, given the favorable factors and record of consistent earnings growth, First Republic is less likely to default in interest payment and debt repayment if the economic situation worsens.
- ▲ First Republic has complied with all regulatory ratio requirements since its inception. It has also been able to generate higher cash flow amid an increasingly difficult operating environment. As of Sep 30, 2020, the bank's Tier 1 leverage ratio was 8.38%. We believe a strong capital position will help it grow organically as well as through strategic acquisitions in the near future.
- ▲ First Republic's trailing 12-month return on equity (ROE) reflects its superiority in terms of utilizing shareholders' fund. The company's ROE of 10.96% compares favorably with the industry's 8.75%.
- ▲ Shares of First Republic have outperformed the industry year to date. With this favorable trend, the company's earnings estimates for 2021 have been revised marginally upward over the past seven days. Therefore, given the progress on fundamentals and positive estimates revision, the stock has upside potential.

First Republic's growth prospects look promising driven by consistent growth in loans and deposits. Further, the company continues to benefit from an improving NII and strong capital position.

Reasons To Sell:

- ▼ Rising operating expenses have been a concern for First Republic. Costs witnessed a five-year CAGR (2015-2019) of 18.3%, with the trend continuing in the first nine months of 2020. Notably, cost savings from completed build-out of systems and processes required for crossing \$50 billion in total assets are being invested into digital initiatives including mobile banking applications and data analytics. As such, operating costs are likely to remain elevated in the near term which is likely to create pressure on bottom-line growth.
- ▼ First Republic's NIM is affected by the flattening of yield curve — a decline in longer-term yields relative to short-term yields. Since 2013, the company's NIM has been contracting and the trend continued in first nine months of 2020 as well. Notably, lower tax-equivalent yields on tax-advantaged investments and tax-exempt loans from the reduction of the federal tax rate for corporations led to the decline in margin in 2018. Further, the Federal Reserve's move to cut interest rates to near zero in March to protect the economy from the coronavirus-induced mayhem likely to keep margins under pressure in the quarters ahead.
- ▼ First Republic's capital deployment activities do not seem impressive. Though the company increased its common stock dividend by 5.3% this April, it has no share buyback plans in place. Also, First Republic's debt/equity ratio does not compare favorably with the broader industry. Thus, such dividend payments might not be sustainable in the long term.
- ▼ First Republic seems overvalued when compared with the broader industry. Its current price-to-book and price-earnings (F1) ratios are above the respective industry averages.

Mounting operating expenses and shrinking net interest margins remain major near-term headwinds for First Republic. Additionally, the company's capital deployment activities look unsustainable.

Last Earnings Report

First Republic Q3 Earnings Beat, Revenues & Costs Rise

First Republic delivered a positive earnings surprise of 16.7% in third-quarter 2020 aided by solid top-line strength. Earnings per share of \$1.61 surpassed the Zacks Consensus Estimate of \$1.38. Additionally, the bottom line climbed 22.9% from the year-ago quarter.

Results were supported by an increase in NII and fee income. Moreover, the company's balance-sheet position was strong during the quarter. However, higher expenses and elevated provisions were offsetting factors.

Net income available to common shareholders jumped 25.3% year over year to \$278.3 million.

Revenues Rise, Costs Increase

Total revenues were \$1 billion, up 19.6% year over year. The figure surpassed the Zacks Consensus Estimate of \$956.5 million.

NII jumped 19.5% year over year to \$830.3 million, primarily supported by growth in average earning assets and decline in interest costs. It was partly mitigated by lower net interest margin, which declined to 2.71% from 2.80%.

Non-interest income was \$171 million, up 20.2% year over year. This rise mainly resulted from elevated gain on sale of loans, higher investment management fees and income from investments in life insurance.

Non-interest expenses for the reported quarter flared up 13.9% year over year to \$608.2 million. Rise in salaries and benefits, information systems expenses and continued investments in the expansion of the franchises led to the uptick.

The efficiency ratio was 60.7% compared with the 63.8% recorded in the prior-year quarter. It should be noted that a fall in the efficiency ratio indicates higher profitability.

Impressive Balance Sheet Position

As of Sep 30, 2020, net loans climbed 4.8% sequentially to \$104.2 billion, while total deposits were up 6% to \$104.4 billion. Loan originations, including PPP loans, came in at \$12.2 billion, up 11.6% sequentially.

First Republic's total wealth management assets were \$168.2 billion as of Sep 30, 2020, marking an 8% sequential rise. This increase was primarily supported by market appreciation and net client inflow.

Wealth management assets included investment management assets of \$74.7 billion, brokerage assets and money market mutual funds of \$81.2 billion along with trust and custody assets of \$12.3 billion.

Credit Quality: A Mixed Bag

During the reported quarter, credit metrics were a mixed bag. On a year-over-year basis, total non-performing assets increased 20% to \$164.2 million. Also, provision for loan losses was up 70.8% to \$28.5 million.

Yet, non-performing assets to total assets ratio was 0.12%, stable year over year. Also, net loan charge-offs were \$1.67 million, down 61.1%.

Capital Position

As of Sep 30, 2020, the company's Tier 1 leverage ratio was 8.38%, reflecting a contraction of 12 basis points from the prior-year quarter. Tier 1 capital to risk-weighted assets was 11.5%, up from 11.05%. Common equity Tier 1 capital to risk-weighted assets ratio was 9.78% compared with the prior year's 9.91%.

Tangible book value per share increased 12.6% to \$55.00.

Outlook 2020

The company anticipates net interest margin of 2.65-2.75%.

Management expects efficiency ratio between 62.5% and 64.5%.

Further, tax rate is anticipated to be between 20% and 21%.

Quarter Ending	09/2020
Report Date	Oct 13, 2020
Sales Surprise	4.68%
EPS Surprise	16.67%
Quarterly EPS	1.61
Annual EPS (TTM)	5.60

Recent News

Dividend Update

On Oct 13, First Republic announced a quarterly cash dividend of 20 cents per share. The dividend was paid on Nov 12 to shareholders on record as of Oct 29.

Valuation

First Republic's shares are up 17.6% in the year-to-date period and 17.6% over the trailing 12-month period. Stocks in the Zacks sub-industry is up 0.5 while the Zacks Finance sector is down 4.7% in the year-to-date period. Over the past year, the Zacks sub-industry and the sector is down 0.4 and 4.1%, respectively.

The S&P 500 Index is up 15% in the year-to-date period and 15.7% in the past year.

The stock is currently trading at 22.87X forward 12 months earnings, which compares to 15.41X for the Zacks sub-industry, 17.00X for the Zacks sector and 22.68X for the S&P 500 Index.

Over the past five years, the stock has traded as high as 23.78X and as low as 14.33X, with a 5-year median of 18.92X. Our Neutral recommendation indicates that the stock will perform in line with the market. Our \$145 price target reflects 24.01X forward earnings.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	F
Momentum Score	F
VGM Score	F

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
