Summary

Hormel Foods has lagged the industry in the past six months. The company is seeing declines in its foodservice business amid COVID-19-led social distancing. During first-quarter fiscal 2021, net sales in U.S. foodservice channel fell 17% year over year. That said, management expects to witness recovery in the foodservice industry in fiscal 2021. Apart from this, the company is facing higher supply-chain costs related to the pandemic. This hurt fiscal first-quarter earnings, which fell 9%. Nevertheless, the company is impressed with growth witnessed in the International & Other unit. Notably, sales in the segment rose 13% in the quarter. Also, Hormel Foods' focus on innovation and boosting capacity with strategic investments are yielding. With rising health consciousness, the company is focusing on growing its plant-based food options.

Overview

Austin, MN-based Hormel Foods Corporation (HRL) is a leading manufacturer and marketer of various meat and food products in the U.S. and international markets. In fiscal 2017, Hormel Foods reported revenue results through five segments: On Nov 21, 2017, Hormel Foods declared that it has consolidated the Specialty Foods segment into the Grocery Products segment.

Grocery Products (24.8% of total revenues in fiscal 2020): This segment consists primarily of the processing, marketing and sale of shelf-stable food products sold predominantly in the retail market.

Refrigerated Foods (54.9% of total revenues in fiscal 2020): This segment includes the Hormel Refrigerated, Burke Corporation (Burke) and Dan's Prize operating segments. It consists primarily of the processing, marketing and sale of branded and unbranded pork and beef products for retail, food service and fresh-product customers.

Jennie-O Turkey Store (13.9% of total revenues in fiscal 2020): This segment consists primarily of the processing, marketing and sale of branded and unbranded turkey products for retail, food service and fresh product customers.

International & Other (6.4% of total revenues in fiscal 2020): This segment includes the Hormel Foods International ('HFI') operating segment, which manufactures markets and sells the company's various miscellaneous corporate products internationally.

The company concluded the divestiture of CytoSport business to PepsiCo. The transaction was valued at nearly \$465 million.

Reasons To Buy:

- ▲ **Robust International & Other Unit:** Hormel Foods' International & Other segment has been performing well for a while now. During the first quarter of fiscal 2021, International & Other sales increased 13% to \$183.2 million. Notably, the company saw broad-based strength across branded businesses that included continued growth in China and robust sales of SPAM luncheon meat as well as SKIPPY peanut butter. Segment profit surged 61% on improved results for branded exports and acceleration of recovery in China. Also, increased income from partners in the Philippines, South Korea and Europe was a reason. In fact, management believes that the International segment is well positioned to grow during fiscal 2021 driven by continued strength in its China business, branded exports and global partnerships.

Hormel Foods continues to gain from strength in International & Other segment. Also, the company's focus on innovations is impressive.

Prior to this, sales in the segment increased 8% during the fourth quarter of fiscal 2020. We believe that continuation of this trend is likely to keep driving the company's performance in the future.

- ▲ **Brand Strength & Innovation:** Hormel Foods' focus on innovation is yielding results. Notably, products such as SPAM, SKIPPY, Hormel chili, Hormel Black Label, Applegate, Hormel pepperoni and Lloyd Hormel fully cooked entrees among others have been contributing to the upside. In recent endeavors, the company introduced the Hormel pretzel bites and cheese tray — a new addition to the Hormel Gatherings line. This new introduction is likely to bring restaurant trends inside consumers' homes. Also, the launch is appropriate during increasing home-based working and schooling trend as well as smaller get-togethers amid the coronavirus outbreak. In December 2020, the company introduced its new plant-based protein puffs under the Happy Little Plants. With rising health consciousness, plant-based food alternatives are gaining prominence. This provides opportunities for companies like Hormel Foods to diversify and grow.

Well, the company has been making strategic advertisement investments to support growth of its brands. Additionally, it focuses on launching products to meet consumers' preferences. In this regard, Hormel Foods' earlier informed that it has been conducting virtual products showcases amid the coronavirus outbreak.

- ▲ **Efforts to Enhance Capacity:** Hormel Foods is on track with strategic investments for boosting capacity. Notably, the company incurred capital expenditures of \$40 million in the first quarter of fiscal 2021. During the quarter, management commenced its Burke pizza toppings plant expansion. In its last earnings call, management also highlighted that it is focusing on expanding the capacity of its pepperoni business. In December 2020, the company announced the opening of a new manufacturing plant — Papillion Foods — situated in Papillion, NE. The new 535,000-square feet facility will manufacture salami and dry sausage items under the Columbus Craft Meats and Hormel brands. Well, management expects capital expenditures of \$260 million for fiscal 2021.

- ▲ **Financial Analysis:** Hormel Foods ended fiscal first-quarter with cash and cash equivalents of \$1,751.5 million, while current maturities of its long-term debt stood at \$258.7 million. The company's long-term debt (less current maturities) totaled \$1,043 million at the end of first-quarter fiscal 2021 (as of Jan 24, 2021), slightly below \$1,044.9 million at the end of fourth-quarter fiscal 2020.

Recently, Hormel Foods announced a quarterly dividend of 24.50 cents per share. This is payable on May 17, 2021, to shareholders of record as on Apr 12. We note that, this is the company's 371st straight quarterly dividend. Notably, Hormel Foods has a dividend payout of 60.1%, dividend yield of 2.1% and free cash flow yield of 3.2%.

- ▲ **Focus on Buyouts:** Hormel Foods intends to strengthen its business on the back of strategic acquisitions. On Feb 11, 2021 the company announced the acquisition of Planters snack nuts business for an effective purchase price of \$2.79 billion from The Kraft Heinz Company. The deal, which includes Planters, NUT-rition, Planters Cheez Balls and Corn Nuts brands, is expected to close in calendar second-quarter of 2021. Further, the company acquired a Texas-based pit-smoked meats company, Sadler's Smokehouse (March 2020). The buyout is in sync with Hormel Foods' initiatives to strengthen position in the foodservice space. Further, the Columbus (November 2017) and Fontanini (August 2017) buyouts have been aiding performance. Notably, through the inclusion of Columbus, the company has been able to develop the new Hormel deli solutions division, which is included within refrigerated foods, and is helping meet retailer needs. Also, the Ceratti acquisition (Aug 2017) is aiding the International segment. These buyouts are expected to continue boosting performance in the forthcoming periods.

Reasons To Sell:

- ▼ **COVID-19 Hurts Q1 Earnings:** Shares of Hormel Foods have lost 5.6% in the past six months against the industry's growth of 12%. During the first quarter of fiscal 2021, earnings of 41 cents per share declined 9% year over year. We note that incremental supply-chain costs amid the pandemic put pressure on the bottom line. Also, higher tax expenses were a drag on the performance.

Prior to this, earnings of 43 cents per share also declined 9% in the fourth quarter of fiscal 2020 thanks to increased supply chain costs associated with COVID-19. We believe that continuation of this trend is likely to keep hurting the company's bottom line performance in the future.

- ▼ **Pandemic-Led Cost Concerns:** Hormel Foods' has been seeing escalated costs associated with COVID-19. During the first quarter of fiscal 2021, the company absorbed nearly \$15 million in direct incremental supply-chain costs mainly induced by reduced production volumes and better safety measures in its manufacturing facilities amid the pandemic. Prior to this, the company absorbed more than \$80 million in increased supply chain costs related to the pandemic in fiscal 2020. In fact, management expects these temporary costs to decline only after COVID-19 subsides.

- ▼ **Foodservice Business Challenges:** In spite of strong performance in Hormel Foods' retail business, the company is seeing declines in its foodservice business amid the pandemic. This could be attributed to reduced demand from various foodservice venues like college and universities in the wake of COVID-19 induced social distancing. During the first quarter of fiscal 2021, net sales in U.S. foodservice channel declined 17% year over year. Hormel Foods' operating margin in the quarter stood at 10.9%, down from 11.8% reported in the year-ago quarter, thanks to reduced sales and profitability in the foodservice business. That said, the company expects to see recovery in its foodservice business.

- ▼ **Industry Related Threats:** The food industry is witnessing stiff competition and aggressive promotional environment. The company faces intense competition from other food companies on the grounds of quality, prices and availability. To meet such competitive pressure effectively, Hormel Foods may have to lower prices for products or indulge in marketing activities to maintain market share. Additionally, the outbreak of any livestock diseases is likely to disrupt the company's operations and profitability.

Weakness in the Foodservice business along with higher supply chain costs related to COVID-19 hurt Hormel Foods' first-quarter fiscal 2021 performance.

Last Earnings Report

Hormel Foods Q1 Earnings Beat Estimates, Sales up Y/Y

Hormel Foods posted first-quarter fiscal 2021 results, with the top and the bottom line surpassing the Zacks Consensus Estimate. Also, sales increased year over year on the back of growth across all segments. However, earnings declined year over year.

Quarter in Detail

Quarterly earnings of 41 cents per share surpassed the Zacks Consensus Estimate of 40 cents. However, the bottom line declined 9% year over year.

Quarter Ending 01/2021

Report Date	Feb 18, 2021
Sales Surprise	3.21%
EPS Surprise	2.50%
Quarterly EPS	0.41
Annual EPS (TTM)	1.63

Net sales in the first quarter were \$2,461.1 million, which surpassed the Zacks Consensus Estimate of \$2,384.5 million. Moreover, the top line increased 3% year over year. Sales growth across all the segments drove the top line. However, volumes were 1.2 billion lbs, down 1% year on year. Channel-wise, net sales across U.S. retail, U.S. deli and International climbed up 13%, 7%, and 9%, respectively. However, net sales in U.S. foodservice channel declined 17%.

Selling, general and administrative expenses were flat at \$196.4 million. Operating margin in the first quarter stood at 10.9%, down from 11.8% reported in the year-ago quarter, thanks to reduced sales and profitability in the foodservice business.

Segment Details

Net sales in the **Grocery Products** unit increased 7% to \$577.6 million. Volumes were also up 4%. The upside can be attributed to strength in various center store products like the SPAM family of products, SKIPPY spreads and Hormel Compleats meals among others. Profits in the unit surged 35% driven by increased sales, favorable mix and greater earnings from the MegaMex business.

Net sales in the **Jennie-O Turkey Store** segment inched up 1% to \$333.3 million, while volumes declined 2%. Upside in sales was backed by growth in the complete retail portfolio, led by double-digit growth of Jennie-O lean ground and Jennie-O Oven Ready items. Also, solid holiday sales of whole birds were a reason. However, significantly reduced foodservice sales were a drag. Segment profit tanked 30% due to contraction in foodservice sales. Also, high supply chain costs associated with the pandemic and increased freight expenses dented profits.

The company's **Refrigerated Foods** generated sales of \$1,367.1 million, up 1% year over year. However, volumes declined 2%. Gains from sales growth in retail and deli were countered by significant decline in foodservice business. Segment profit fell 16% due to sluggish foodservice sales, high supply chain costs related to pandemic and lower commodity profits.

International & Other sales increased 13% to \$183.2 million, while volumes fell 5%. Notably, the company saw broad-based strength across branded businesses that included continued growth in China and robust sales of SPAM luncheon meat as well as SKIPPY peanut butter. Segment profit surged 61% on improved results for branded exports, acceleration of recovery in China. Also, increased income from partners in the Philippines, South Korea and Europe was a reason.

Balance Sheet & Cash Flow

The company ended the quarter with cash and cash equivalents of \$1,751.5 million and long-term debt of \$1,043.1 million (excluding current maturities). For 13-weeks ended Jan 24, 2021, Hormel Foods generated cash of \$206 million from operating activities. Operating free cash flow amounted to \$165 million. Management expects capital expenditures of \$260 million for fiscal 2021.

We note that on Feb16, the company paid out its 370th straight quarterly dividend of 98 cents.

Other Details

During the quarter, the company absorbed nearly \$15 million in direct incremental supply chain costs mainly induced by reduced production volumes and better safety measures in its manufacturing facilities amid the pandemic. Management expects these temporary costs to minimize after COVID-19 subsides.

On Feb 11, 2021 the company announced the acquisition of Planters snack nuts business for an effective purchase price of \$2.79 billion. The deal which includes Planters, NUT-rition, Planters Cheez Balls and Corn Nuts brands is expected to close in calendar second quarter of 2021.

Outlook

Management projects net sales in the range of \$9.70-\$10.30 billion and earnings per share in the band of \$1.70-\$1.82 in fiscal 2021. The guidance does not take into account the impact of recent acquisition of Planters snack nuts business.

The company is impressed with momentum in its retail and deli teams going into the second quarter. Management believes that the International segment is well positioned to grow during the year driven by continued strength in its China business, branded exports and global partnerships. Hormel Foods also expects to see recovery in its foodservice business.

Recent News

Hormel Foods Declares Dividend – Mar 22, 2021

Hormel Foods announced a quarterly dividend of 24.50 cents per share. This is payable on May 17, 2021, to shareholders of record as on Apr 12. We note that, this is the company's 371st straight quarterly dividend.

Hormel Foods Introduces Pretzel Bites With Cheese – Feb 16, 2021

Hormel Foods introduced the Hormel pretzel bites and cheese tray — a new addition to the Hormel Gatherings line. This first of its kind product is priced at \$6.99-\$7.99 and is available for purchase in the deli department across some retailers starting this month. The Hormel pretzel bites and cheese tray consists of four ounces of soft pretzel bites as well as cheddar cheese sauce with a sea salt packet. This easy-to-make product is apt for up to four people.

Hormel Foods to Acquire Planters snack nuts business – Feb 11, 2021

Hormel Foods announced the acquisition of Planters snack nuts business for an effective purchase price of \$2.79 billion from The Kraft Heinz Company. The deal which includes Planters, NUT-rition, Planters Cheez Balls and Corn Nuts brands is expected to close in calendar second quarter of 2021.

Valuation

Hormel Foods shares are down 1.4% in the year-to-date period and 1.9% over the trailing 12-month period. Stocks in the Zacks sub-industry are up 9.3% in the year-to-date period, while the Zacks Consumer Staples sector increased 3.4%. Over the past year, the Zacks sub-industry is up 13.1%, while the sector gained 23%.

The S&P 500 index is up 12.3% in the year-to-date period and 46.5% in the past year.

The stock is currently trading at 25.66X forward 12-month earnings, which compares to 17.43X for the Zacks sub-industry, 20.57X for the Zacks sector and 22.93X for the S&P 500 index.

Over the past five years, the stock has traded as high as 29.83X and as low as 17.63X, with a 5-year median of 22.85X. Our Neutral recommendation indicates that the stock will perform in line with the market. Our \$48 price target reflects 26.8X forward 12-month earnings.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	B
Growth Score	C
Momentum Score	B
VGM Score	B

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

This material represents an assessment of the market and economic environment at a specific point in time and is not intended to be a forecast of future events, or a guarantee of future results. Forward-looking statements are subject to certain risks and uncertainties. Any statements that refer to expectations, projections or characterizations of future events or circumstances, including any underlying assumptions, are forward-looking statements. Actual results, performance, or achievements may differ materially from those expressed or implied.

Returns quoted represent past performance which is no guarantee of future results. Investment returns and principal value will fluctuate so that when shares are redeemed, they may be worth more or less than their original cost. Current performance may be higher or lower than the performance shown.

Investing involves risk; principal loss is possible. There is no guarantee that companies that can issue dividends will declare, continue to pay or increase dividends.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
