Summary

Macerich's shares have underperformed the industry in the past year. Amid the ongoing pandemic, the company continues to witness a negative impact on leasing revenues, rent collections and occupancy rates at its properties. Higher e-commerce adoption, store closures and tenant bankruptcy remain woes. Nonetheless, Macerich has a concentration of premium shopping centers in vibrant markets and is likely to gain from resumption of economic activity. Moreover, pent-up demand for in-store retail experience is propelling sales at reopened properties and driving lease renewals. Efforts to support omni-channel retailing and balance-sheet strengthening moves will help it sail through the crisis. In fact, two consecutive dividend cuts facilitated Macerich to preserve liquidity and financial flexibility amid the persistently uncertain environment.

Overview

Founded in 1994 and headquartered in Santa Monica, CA, The Macerich Company is a retail real estate investment trust (REIT) that owns, acquires, leases, manages, develops, and redevelops regional and community shopping centers in high barrier-to-entry markets.

Macerich primarily focuses on the attractive, densely populated markets of the United States. It has notable presence in the West Coast, Arizona, Chicago, and the Metro New York to Washington, DC corridor.

At present, Macerich's real-estate ownership spreads 51 million square feet of space, comprising mainly interests in 47 regional shopping centers and five community/ power shopping centers. As of Mar 31, 2020, its mall portfolio occupancy was 93.1%.

Notably, Macerich's joint venture Hudson Pacific Properties is engaged in redevelopment of One Westside into 584,000 square feet of creative office space and 96,000 square feet of dining and entertainment space. The full office space has been leased to Google and is projected to be completed in 2022.

Moreover, the company has a 50/50 joint venture with Simon Property Group to develop Los Angeles Premium Outlets in Carson, CA. The first phase will open, with an area spanning 400,000 square feet, and the second phase will comprise additional 165,000 square feet.

Note**: All EPS numbers presented in this report represent FFO per share. FFO, a widely used metric to gauge the performance of REITs, is obtained after adding depreciation and amortization and other non-cash expenses to net income.

Source: Zacks Investment Research

Reasons To Buy:

- ▲ Macerich has a high concentration of premium malls in vibrant U.S. markets. These properties are located in densely-populated areas, where affluent consumers with significant disposable incomes live, work and play, offering the company solid scope to generate decent cash flows. The company also has a number of well-capitalized retailers that are positioned to navigate through the current challenging environment.
- ▲ Macerich has been focusing on an aggressive capital-recycling program, which involves the divestiture of non-core and slower-growth assets, and usage of the proceeds in higher-growth properties through acquisitions, developments and redevelopment initiatives. In fact, the company raised \$1.8 billion over the past six years through its capital-recycling program, disposing of lesser quality assets in slower-growing, secondary and tertiary markets. Apart from raising capital, the strategic dispositions reduced impending bankruptcy issues across the lower quality disposition portfolio. Meanwhile, the company's joint venture with Hudson Pacific Properties is redeveloping One Westside into 584,000 square feet of creative office space and 96,000 square feet of dining and entertainment space, which will serve as Google's new office campus. The company noted that work is on the project despite the pandemic and is fully funded by a non-recourse construction loan. We expect such moves to offer an upside potential to the company and strengthen its high-end portfolio.
- ▲ With the relaxation of the shelter-in-place orders in the upcoming period and resumption of the economy, this retail REIT is poised to benefit from its superior assets in premium locations. On Jun 18, 2020, Macerich announced that all 47 of its major retail properties nationwide are now open for business, and a number of centers are witnessing traffic numbers "approaching near normal levels", indicating a healthy return to business. Also, the federal stimulus is lessening the income impact of unemployment and hence, retail sales are likely to benefit, in turn, benefiting the retail landlords which house the retailers. In fact, the company is witnessing numerous lease renewals relating to 2020 lease expirations on the back of pent-up demand for in-store retail experience that is also driving steady footfall and sales.
- ▲ Macerich has been making efforts to enhance its assets quality as well as customer relationships through increasing adoption of the omni-channel model. In light of the pandemic, the omni-channel business model has become crucial among several store retailers, while digital brands with brick-and-mortar presence are playing a key role in satisfying orders. Amid the current crisis, with store closures to curb the coronavirus spread, several retailers have been fulfilling orders out of their mall-based stores. Also, retailers have already been catering to thousands of curbside/online pick-up orders daily. Even subsequent to reopening of all business, curbside pick-up is likely to gain attention. Macerich remains committed to accommodate curbside pick-up for its retailers and such efforts are likely to add competitive advantage. Also, shift towards re-use and mixed-use properties through recapture and repositioning of anchor tenants remains a key emphasis.
- ▲ In light of the coronavirus pandemic, the resultant uncertainty and a disrupted rent-collection environment, Macerich has rolled out measures to preserve its liquidity. The company has drawn bulk of the remaining capacity on its \$1.5-billion revolving line of credit. It exited second-quarter 2020 with \$573 million of cash on its balance sheet, including joint ventures at the company's share. Furthermore, the redevelopment pipeline has been considerably reduced for the rest of the current year. Apart from these, the company lowered controllable shopping center expenses by 35-45% during the period. The company announced a reduction of quarterly dividend for the third quarter to 15 cents per share. This cut in dividend will help it preserve roughly \$370 million of cash on an annualized basis, if the same dividend rate is maintained for the next two quarters. Such efforts are likely to help the company sail through the current challenging times.
- ▲ Shares of Macerich have underperformed the industry it belongs to in the past year. During this period, shares of the company have plummeted 74% compared with the industry's 21.3% decline. Nonetheless, the trend in estimate revisions for FFO per share for the current year indicates a favorable outlook for the company. In fact, the Zacks Consensus Estimate for 2020 FFO per share has been revised 4.1% upward over the past month. Therefore, given the positive estimate revisions, the stock has decent upside potential.

Concentration of premium shopping centers in vibrant markets, efforts to support omni-channel retailing, along with balance-sheet strengthening moves, will aid Macerich sail through the current crisis.

Reasons To Sell:

- ▼ Mall traffic continues to decline due to a change in shopping patterns with online purchases taking precedence. This has forced retailers to reconsider their strategy and shift investments from traditional retailing to online channels and optimize their brick-and-mortar presence. These optimization efforts and the consequent decision to close stores by a number of retailers have raised concerns over cash flows of mall landlords. Also, retailers unable to cope with competition have been filing bankruptcies. This is affecting the demand for retail real estate space and emerged as a pressing concern for retail REITs like Macerich. The company has been witnessing higher volumes of tenant bankruptcies and these are expected to weigh on Macerich's operating results. Moreover, the coronavirus pandemic is likely to keep retail REITs on tenterhooks with dwindling footfall in the properties amid social-distancing mandates and higher e-commerce adoption.
- ▼ The high number of coronavirus cases has forced several retailers to close stores, in order to contain the spread of the virus. Some retailers have also reduced store hours, while many others are keeping their e-retail operations running as consumers are now increasingly opting for online purchases. As a result, retail REITs, including Macerich, which have already been battling store closures and bankruptcy issues, are feeling the brunt. In addition, given the financial stress on its tenants, rent collection is likely to suffer in the near term.
- ▼ Solid dividend payouts remain the biggest attraction for REIT investors and Macerich had remained committed to that. However, the company made a reduction of dividend from 75 cents per share to 50 cents per share for the second quarter and to 15 cents per share for the third quarter. The third-quarter dividend will be paid on Sep 8, 2020 to stockholders of record on Aug 19, 2020.
- ▼ The company has a substantial number of centers positioned across California, New York and Arizona. This geographical concentration risk will likely weigh upon its earnings in times of economic uncertainty. In fact, the majority of the company's 47 retail properties nationwide are now open for business. However, the company noted that two malls in the New York City and nine indoor malls in California were closed. Also, choppy real estate conditions in New York will likely remain a concern in the near term.

Shrinking traffic at its properties, store closures and tenant bankruptcy are concerns, while rent collection issues amid the pandemic add to its woes. Substantial asset concentration raises its risk.

Last Earnings Report

Macerich Q2 FFO, Revenues Miss, NOI Slips

Macerich reported second-quarter adjusted FFO per share of 39 cents which missed the Zacks Consensus Estimate of 46 cents. The figure also plunged 55.7% year over year. Adjusted FFO per share for the quarter excludes financing expense in relation to Chandler Freehold and loss on extinguishment of debt.

Results reflect the pandemic's adverse impact and the related temporary closure of its properties as well as rent collection woes.

The company generated revenues of \$178.6 million in the June-end quarter. The figure declined 21.7% year on year as well as missed the Zacks Consensus Estimate of \$191 million.

The company noted that majority of its properties are now open. However, Queens Center and Kings Plaza in New York City have been closed since March 2020, while nine indoor California malls, which previously opened in May and early June, were closed for a second time in July pursuant to a statewide mandate.

Macerich is making negotiations with national and local tenants to secure rental payments, and collected roughly 46%, 58% and 66% of billings in the second quarter, June and July, respectively.

Moreover, the company noted that it has entered into several leases for new stores and concepts aggregating 1.3 million square feet for planned openings in mainly 2020 and 2021. It has slashed the planned 2020 development expends by roughly \$90 million, though work continues on some select projects.

In March, Macerich withdrew the previously-issued guidance for 2020. It has not issued any updated outlook as of now due to the prevailing uncertainties.

Behind the Headlines

As of Jun 30, 2020, average rent per square foot rose 2.1% to \$62.48 from \$61.17 as of Jun 30, 2019. Mall tenant annual sales for the 12-month period ended Jun 30, 2020 decreased to \$774 per square feet from \$776 for the 12-month period ended Jun 30, 2019. Notably, the sales metric excludes the period of coronavirus closure for each tenant.

However, as of Jun 30, 2020, the mall portfolio occupancy shrunk 280 basis points year over year to 91.3%. Also, same-center net operating income (excluding lease termination income) slid 23.1% to \$163 million from the prior-year number.

It exited second-quarter 2020 with \$497.6 million of cash and cash equivalents on its balance sheet.

Quarter Ending	06/2020
Report Date	Aug 11, 2020
Sales Surprise	-6.49%
EPS Surprise	-15.22%
Quarterly EPS	0.39

Recent News

Macerich's Retail Assets Open, Witness Healthy Initial Traffic – Jun 18, 2020

Macerich announced that all 47 of its major retail properties nationwide are now open for business, and a number of centers are witnessing traffic numbers "approaching near normal levels", indicating a healthy return to business.

However, the company noted that six of its properties in New York, two in New Jersey, and one in Pennsylvania are presently offering limited retail operations, including "curbside pickup" and retail with exterior access. Excluding these properties, other shopping centers of Macerich are ushering in shoppers.

The company noted that the South Plains Mall in Texas, which opened on May 1, registered 93.5% of year-over-year traffic on Jun 14. Meanwhile, Vintage Faire Mall in California's Central Valley, fully open since May 22, witnessed 97.1% traffic on the same day. Further, the company noted that Flatiron Crossing in Colorado, which reopened on Jun 16, also recorded healthy initial traffic of 33% on its first day.

Doug Healey, who serves as the senior executive vice president, leasing for Macerich, also pointed out that "Beyond increasingly strong shopper traffic, some key retail partners including Macy's and Nordstrom are describing better-than-expected sales at their reopened physical stores." This resumption of activity is encouraging for Macerich, as it helps the company's tenants to generate cash flows from their business and make rent payments.

Thomas O'Hern, the company's chief executive officer, noted that "local economies benefit in many important ways from strong retail activity." The company's centers generate employment for more than 110,000 people nationwide. Further, the portfolio makes \$1.1 billion in sales tax revenues and \$225 million in property taxes. These, in turn, support essential services, per the company's press release.

Dividend Update

On Jul 24, Macerich announced a quarterly cash dividend of 15 cents per share, marking a cut of 75% from the prior payout. The dividend will be paid on Sep 8 to shareholders of record as of Aug 19.

The company informed that this reduction in dividend will allow the company to bolster its liquidity and financial flexibility amid the uncertain macroeconomic environment due to the coronavirus pandemic.

Valuation

Macerich's shares have been down 74% in the trailing 12 months. Stocks in the Zacks sub-industry and the Zacks Finance sector have declined 21.3% and 8.5%, respectively, over the past year.

The S&P 500 Index has increased 10.8% over the trailing 12-month period.

The stock is currently trading at 3.33X forward 12-month FFO, which compares to 13.66X for the Zacks sub-industry, 16.66X for the Zacks sector and 22.86X for the S&P 500 Index.

Over the past five years, the stock has traded as high as 21.02X and as low as 1.52X, with a 5-year median of 14.22X. Our neutral recommendation indicates that the stock will perform in line with the market. Our \$8.75 price target reflects 3.52X FFO.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	A
Growth Score	F
Momentum Score	B
VGM Score	C

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
