Summary

Marathon Petroleum's sale of its Speedway business for \$21 billion is expected to provide the downstream operator with a much-needed cash infusion. Another positive aspect of the deal is a 15-year fuel supply agreement per which Marathon Petroleum will supply about 7.7 billion gallons of gasoline per year to 7-Eleven, thus ensuring a steady revenue stream. However, Marathon Petroleum has been bogged down by the coronavirus-induced oil products demand destruction. As a proof of the challenging environment, Marathon Petroleum's key Refining & Marketing segment reported second-quarter operating loss of \$1.6 million, as against income of \$906 million in the year-ago quarter, with margins down significantly. A deteriorating debt profile is another negative in the Marathon Petroleum story. As such, the stock warrants a cautious stance.

Overview

Findlay, OH-based Marathon Petroleum Corporation is a leading independent refiner, transporter and marketer of petroleum products. The company, in its current form, came into existence following the 2011 spin-off of Houston, TX-based Marathon Oil Corporation's refining/sales business into a separate, independent and publicly-traded entity. In October 2018, Marathon Oil completed the acquisition of its rival Andeavor in a \$23.3 billion deal, thereby becoming the nationwide largest refining company by market capitalization. The deal also made the company the largest U.S. refiner and the fifth largest in the world by capacity.

Marathon Petroleum operates in three segments: Refining and Marketing, Retail, and Pipeline Transportation.

Refining and Marketing: The unit's operations include 16 refineries, located in the West Coast, Gulf Coast and the Mid-Continent regions of the United States, having a combined crude processing capacity of more than 3 million barrels per day. Additionally, Marathon Petroleum – through its marketing organization – sells transportation fuels, asphalt and specialty products throughout the country to support commercial, industrial and retail operations. This segment contributed 31% of the company's 2019 earnings.

Retail: Marathon Petroleum has a retail footprint in Enon, OH, known as Speedway LLC, which is the second largest chain of company-owned and -operated gasoline and convenience stations in the United States. The retail segment consists of approximately 3,923 stores in the United States. The unit also includes contribution from the acquired retail assets of Andeavor. The 'Retail' segment contributed around 21% of the company's total earnings in 2019.

Midstream: This unit mainly reflects Marathon Petroleum's general partner and majority limited partner interests in MPLX LP and Andeavor Logistics LP - publicly-traded master limited partnerships that own and operate gathering and processing assets along with crude transportation and logistics infrastructure. As of Dec 31, Marathon Petroleum owned 63.6% each of MPLX's and ANDX's common units. The 'Midstream' segment contributed around 48% of the company's 2019 earnings.

Source: Zacks Investment Research

Reasons To Buy:

- ▲ Marathon Petroleum's \$23.3 billion acquisition of Andeavor has integrated the premier assets of both the companies, bolstering the scale and leadership position of the combined entity in the United States. As it is, Marathon Petroleum's access to lower cost crude in the Permian, Bakken, and Canada helps it to benefit from the large differentials.
- ▲ Marathon Petroleum's diversified portfolio of refining, retail and midstream operations bode well, somewhat reducing its exposure to volatile commodity price fluctuations. While the company's refining profitability continue to be adversely affected amid lowering crack spreads, Marathon Petroleum's midstream arm MPLX did provide the necessary cushion. MPLX's robust portfolio of projects in the Permian, Marcellus and STACK shale plays offers significant growth opportunities along with fee-based stable revenue stream which is reflected in the parent's company overall results.
- ▲ Marathon Petroleum recently announced the sale of its Speedway business to Japanese retail group Seven & i Holdings – owner of the 7-Eleven convenience store chain – for \$21 billion. Apart from providing Marathon Petroleum with a much-needed cash infusion, the disposal of its Speedway-branded gas stations at a premium price is expected to enhance value for shareholders. Another positive aspect of the deal is a 15-year fuel supply agreement per which Marathon Petroleum will supply about 7.7 billion gallons of gasoline per year to 7-Eleven thus ensuring a steady revenue stream.

Marathon Petroleum's acquisition of Andeavor has expanded its foothold in the Permian Basin, thereby creating an enviable retail and marketing portfolio.

Reasons To Sell:

- ▼ The economic disruption caused by the coronavirus outbreak and the associated demand destruction for refined products and transportation fuels on account of widespread lockdown is set to hurt earnings and cash flows of downstream operators like Marathon Petroleum over the next few quarters. As it is, the company has drastically reduced processing capacity to cope with the demand erosion caused by efforts to stem the spread of the coronavirus.
- ▼ As a proof of the challenging environment, Marathon Petroleum's Refining & Marketing segment reported second-quarter operating loss of \$1.6 million, as against income of \$906 million in the year-ago quarter. The deterioration reflects lower y/y margins. Specifically, refining margin of \$7.13 per barrel decreased significantly versus \$15.24 a year ago. Total refined product sales volumes were 2,878 thousand barrels per day (mbpd), down from the 3,814 mbpd in the year-ago quarter. Moreover, capacity utilization during the quarter was down 26% year over year to 71%. So much so that in response to the collapsing product demand, Marathon Petroleum has announced plans to indefinitely stop production at its Gallup and Martinez refineries.
- ▼ As of Jun 30, Marathon Petroleum had cash and cash equivalents of \$1.1 billion and a total debt of \$34.6 billion higher than the \$34.2 billion in the last quarter. The company has a debt-to-capitalization of 52.9%, reflecting a weak balance sheet. While the company recently entered into a \$1 billion, 364-day revolving credit facility to bolster its finances, investors are worried over the fact that the company has already \$3.5 million drawn on its \$5 billion line of credit.

Investors are worried over the fact that the company has already \$3.5 million drawn on its \$5 billion line of credit.

Last Earnings Report

Marathon Petroleum Posts Narrower-Than-Expected Q2 Loss

Marathon Petroleum reported adjusted loss of \$1.33 per share, narrower than the Zacks Consensus Estimate of a loss of \$1.86. The company's bottom line was favorably impacted by strong-than-expected performance from the Retail and Midstream segments. Operating income from the units totaled \$494 million and \$869 million, ahead of the respective Zacks Consensus Estimates of \$403 million and \$807 million, respectively.

However, the bottom line compared unfavorably the year-earlier quarter's earnings of \$1.73 due to weak showing from the Refining & Marketing segment. The unit's results were dragged down by sharply lower refining margins.

Marathon Petroleum reported revenues of \$15.2 billion that missed the Zacks Consensus Estimate of \$16.2 billion and declined 54.9% year over year.

Forced by the historic oil market crash and the coronavirus-induced demand destruction for the fuel, Marathon Petroleum has already announced a cut to its 2020 capital spending plan by \$1.4 billion, or 30%, to \$3 billion. The company is also targeting a reduction in its operating expenses to \$950 million.

Speedway Sale

Ahead of its earnings release, Marathon Petroleum announced the sale of its Speedway business to Japanese retail group Seven & i Holdings – owner of the 7-Eleven convenience store chain – for \$21 billion. The deal is the biggest in the coronavirus-hit energy space this year and dwarfs Chevron's \$5 billion buyout of Noble Energy. With the sale of its Speedway-branded gas stations the company is expected to enhance value for shareholders – a longstanding demand from activist investor Elliott Management.

Moreover, in response to the collapsing product demand, Marathon Petroleum has announced plans to indefinitely stop production at its Gallup and Martinez refineries.

Y/Y Segmental Performance

Refining & Marketing: The Refining & Marketing segment reported operating loss of \$1.6 million, as against income of \$906 million in the year-ago quarter. The deterioration reflects lower y/y margins.

Specifically, refining margin of \$7.13 per barrel decreased significantly versus \$15.24 a year ago. Total refined product sales volumes were 2,878 thousand barrels per day (mbpd), down from the 3,814 mbpd in the year-ago quarter. Moreover, throughput fell from 3,135 mbpd in the year-ago quarter to 2,276 mbpd. Capacity utilization during the quarter was down 26% year over year to 71%.

Retail: Income from the Retail segment totaled \$494 million, essentially unchanged from the year-ago period as a result of higher fuel margins, offset by lower volumes. In particular, the company's retail fuel margin surged from 26.66 cents per gallon in the second quarter of 2019 to 39.60 cents per gallon in the quarter under review. Meanwhile, same-store merchandise sales fell by 4% year over year while same-store gasoline fuel volume plunged 36.6% from the year-ago period.

Midstream: This unit mainly reflects Marathon Petroleum's general partner and majority limited partner interests in MPLX LP – a publicly traded master limited partnerships that own, operate, develop and acquire pipelines and other midstream assets.

Segment profitability was \$869 million, flat with the second quarter of 2019. Earnings were supported by lower operating expenses, plus contribution from organic growth projects.

Costs, Capex & Balance Sheet

Marathon Petroleum reported expenses of \$14.2 billion in second-quarter 2020, down 55% from the year-ago quarter.

In the reported quarter, Marathon Petroleum spent \$807 million on capital programs (33% on Refining & Marketing and 53% on the Midstream segment) compared to \$1.4 billion in the year-ago period. As of Jun 30, the company had cash and cash equivalents of \$1.1 billion and a total debt of \$32.2 billion, with a debt-to-capitalization ratio of 51%.

Quarter Ending 06/2020

Report Date	Aug 03, 2020
Sales Surprise	-6.34%
EPS Surprise	28.49%
Quarterly EPS	-1.33
Annual EPS (TTM)	1.70

Recent News

Marathon Petroleum to Redeem 2022 Senior Notes

On Sep 1, Marathon Petroleum called for redemption of all \$475 million of its outstanding 5.375% senior notes due 2022. Redemption date will be Oct 1, 2020 and the redemption price of the notes will be 100% of the principal amount.

Valuation

Shares of Marathon Petroleum are down 41.9% and 30.9% on year-to-date basis and over the trailing 12-month period, respectively. Stocks in the Zacks Oil and Gas-Refining and Marketing and the Zacks Oil-Energy sector are down 46.1% and 37.8% in the year-to-date period, respectively. Over the past year, the Zacks sub-industry and sector are down 37.9% and 33.4%, respectively.

The S&P 500 index is up 6.9% in the year-to-date period and 17.4% in the past year.

The stock is currently trading at 10.27X trailing 12-month EV/EBITDA, compared with 9.33X for the Zacks sub-industry, 4.31X for the Zacks sector and 12.59X for the S&P 500 index.

Over the past five years, the stock has traded as high as 11.6X and as low as 4.1X, with a 5-year median of 7.8X. Our Neutral recommendation indicates that the stock will perform in-line with the market. Our \$37 price target reflects 0.29X F12M sales.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	A
Growth Score	B
Momentum Score	C
VGM Score	A

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
