Summary

Murphy USA shares have outperformed the Zacks Oil Refining & Marketing industry over the past year (+10.7% vs. -40.5%) and looks well positioned for future price appreciation. A low-cost, high-volume fuel seller, Murphy USA's stations are located near Walmart supercenters. This enables the company to attract significantly more transactions than its peers. The company's access to pipelines and product distribution terminals is another key competitive advantage, helping to keep costs down in the fiercely competitive retail space. However, Murphy USA's high debt levels, which leave it vulnerable to any volatility in commodity prices is a concern. Gasoline prices have been weak recently. The lower profitability for the most widely used petroleum product have hurt Murphy USA's revenues. Hence, the stock warrants a cautious stance.

Overview

Murphy USA Inc. is a leading independent retailer of motor fuel and convenience merchandise in the United States. The El Dorado, AR-based company, in its current form, came into existence following the 2013 spin-off of Murphy Oil Corporation's downstream business into a separate, independent and publicly-traded entity.

Murphy USA markets refined products through a chain of retail stations, almost all of which are located near a Walmart supercenter, primarily in the Southeast, Southwest and Midwest United States.

As of Dec 31, 2019, the company had 1,489 retail fuel stations – under Murphy USA and Murphy Express brands – encompassing 26 states. Of the total, 1,161 stores are branded Murphy USA, while the remaining 328 are standalone Murphy Express locations. Apart from the retail outlets, Murphy USA operates certain product distribution terminals and ethanol production plants.

The company, which caters to approximately 1.6 million customers daily, also owns a dedicated line space on the Colonial Pipeline - the largest refined products system in the country and the biggest gasoline mover.

Meanwhile, Murphy USA's revenue was down 2.3% year over year to \$14 billion in 2019, while the company's income was \$154.8 million (or \$4.86 per diluted share), down 27.5% year over year. Operating cash flow fell to \$313.3 million in 2019 from \$398.7 million in 2018.

Murphy USA remains committed to returning excess cash to shareholders through continued share buyback programs. As part of this initiative, the fuel retailer repurchased \$165.8 million of its common stock through 2019. For the record, over the past five years, management has returned around \$950 million to shareholders in the form of stock buybacks.

Average retail gasoline prices per gallon during 2019 were \$2.33 versus \$2.48 in 2018. Total retail gallons grew 3.4% to 4.4 billion gallons for the full year while same-store sales (SSS) volumes edged up 1.2%.

In 2020, Murphy USA plans to keep its capital expenditures between \$225 million and \$275 million versus \$215 million incurred last year. Further, the company's 2020 guidance include 30 new stores and up to 25 raze-and-rebuilds.

Source: Zacks Investment Research

Reasons To Buy:

- ▲ Murphy USA's unique high-volume low-cost business model helps it retain high profitability even in the fiercely competitive retail environment. The company, which sells more than 4 billion gallons of retail fuel annually, owns more than 90% of its gasoline stations. This allows Murphy USA to keep its operating expenses low. The proximity of Murphy USA's fuel stations to Walmart supercenters helps the company to leverage the strong and consistent traffic that these stores attract, thereby driving above-average fuel sales volume.
- ▲ Murphy USA's sourcing infrastructure is another key competitive advantage for the company. With access to pipelines and product distribution terminals, Murphy USA is able to access fuel at a cost lower than most of its peers, which allows it to sell retail gasoline at a discount.
- ▲ Through its shareholder-friendly capital allocations, Murphy USA is committed to return a part of its free cash flow to shareholders through continued and ongoing share repurchases. As a proof, the company spend 48% of its capital budget through 2015 to 2019 on stock buybacks.
- ▲ The successful pilot launch of its loyalty program Murphy Drive Rewards in 2018 bodes well. The customer appreciation program, whose rollout should be complete by the second quarter, analyzes customer behavior and is likely to attract new customers and thereby position it for higher profits.

The proximity of Murphy USA's fuel stations to Walmart supercenters helps the company to leverage the strong and consistent traffic that these stores attract.

Reasons To Sell:

- ▼ Gasoline prices have been weak recently. The lower profitability for the most widely used petroleum product have hurt Murphy USA's revenues. To be precise, average retail gasoline prices during the most recent quarter were \$1.90 per gallon, down significantly from \$2.38 per gallon a year ago.
- ▼ We remain concerned about Murphy USA's high debt levels, which leave it vulnerable to any volatility in commodity prices. Its total debt is currently more than \$963 million, with only \$317.5 million in cash & cash equivalents. Importantly, the company's debt-to-capitalization as of the end of third-quarter, 2020 was 53.1%, deteriorating from the sequential quarter's 52.8%.
- ▼ Murphy USA derives a substantial portion of its profits from selling RINs (Renewable Identification Numbers) – environmental credits to comply with new cleaner gasoline production rules – to refiners. Of late, the exemption of dozens of refiners from compliance obligations sent RIN biofuel credit prices tumbling to multi-year lows. This is likely to exert downward pressure on Murphy USA's earnings.
- ▼ Being in the convenience store business, Murphy USA is highly dependent on tobacco sales. With smoking rates falling, the company's tobacco comps continue to remain under pressure. The tepid tobacco sales not only affect top line performance but also limits margin growth.

Decline in gasoline and RIN prices are likely to weigh on Murphy USA earnings.

Last Earnings Report

Murphy USA Q3 Earnings Top Estimates, Increase Y/Y

Murphy USA reported third-quarter 2020 adjusted earnings per share of \$2.61, beating the Zacks Consensus Estimate of \$2.56 and increasing from the year-earlier quarter's bottom line of \$2.55. The outperformance could be attributed to a higher retail margin of 19 cents per gallon, which rose 3.3% year over year.

However, Murphy USA's operating revenues of \$2.8 billion fell 22.4% year over year and missed the Zacks Consensus Estimate by \$147 million due to lower petroleum product sales.

Revenues from petroleum product sales came in at \$2.1 billion, down 30.7% from the third quarter of 2019. But merchandise sales, at \$756.8 million, rose 11.1% year over year.

Key Takeaways

The company's total fuel contribution fell 2.6% year over year to \$219.8 million, impacted by volume contraction, partly offset by margin expansion. Total fuel contribution (including retail fuel margin plus product supply and wholesale results) came in at 22.3 cents per gallon, improving from 20.1 cents per gallon in the third quarter of 2019.

Retail fuel contribution was down 9.1% year over year to \$187.7 million although margins increased to 19 cents per gallon from 18.4 cents in the corresponding period of 2019. Retail gallons declined 11.9% from the year-ago period to 987.3 million in the quarter under review and failed to beat the Zacks Consensus Estimate of 1 billion. Volumes on an SSS basis (or fuel gallons per month) fell 12.7% from the third quarter of 2019. Meanwhile, the average retail gasoline price during the quarter was \$1.90 per gallon, down significantly from \$2.38 per gallon a year ago.

Contribution from Merchandise increased 6.2% to \$118.1 million on higher sales even as unit margins, at 15.6%, fell from the year-ago period's 16.3%. On an SSS basis, total merchandise contribution was up 6.6% year over year in the quarter under review on the back of 9% higher tobacco margins. Meanwhile, merchandise sales rose 10.5% on an SSS basis.

Fuel gallons were down 12.1% from the prior-year period while merchandise sales increased 10.9% on an average per store month (or APSM) basis.

Balance Sheet

As of Sep 30, Murphy USA — which opened four new retail locations, renovated five existing stores and closed one site in the quarter to bring its store count to 1,488 — had cash and cash equivalents of \$317.5 million, and long-term debt (including lease obligations) of \$963.2 million, with a debt-to-capitalization ratio of 51.8%.

During the quarter, the company bought back shares worth \$90 million.

Guidance

Murphy USA reiterated its 2020 projections apart from a \$10 million increase in its selling and general expenses due to charitable contributions made in the third quarter. Based on the continued recovery in customer traffic over the past few months and Murphy USA's excellent operating execution, the company expects to achieve adjusted EBITDA of more than \$500 million in 2021. The company aims to build up to 50 new larger-format stores annually starting next year and 25 raze-and-rebuilds in 2021. The motor fuel retailer added that it is open to grow inorganically as well.

Murphy USA, which claimed that same-store fuel gallons have recovered to 94% of the year-ago levels, came out with an updated capital allocation strategy along with the earnings release. Murphy USA initiated a cash dividend of 25 cents per share with the first instalment to be paid on Dec 1 and announced a \$500 million share repurchase program. The new authorization comes on top of the existing \$400 million scheme, which is likely to conclude in 2021.

Quarter Ending	09/2020
Report Date	Oct 28, 2020
Sales Surprise	-4.91%
EPS Surprise	1.95%
Quarterly EPS	2.61
Annual EPS (TTM)	12.80

Recent News

Murphy USA Inaugurates Its 1500th Store in Mesquite, TX

On Dec 15 Murphy USA recently made an elaborate launch of its 1500th outlet in Mesquite, TX, which also marks the company's 47th store unveiling this year.

Spread across a sprawling 2800 square foot area at 1101 U.S. 80 Frontage Road, this new Murphy Express will present a diversified choice of beverage and snacks. This comprises a beer cave, 20 fountain beverage options, four bean-to-cup coffee stations, hot and cold food items, and other merchandise. It will also include three grades of gasoline along with 16 fueling positions offering diesel and E-85.

The new store marks the company's 9th location, which will shortly come online in the Dallas-Fort Worth region this year. The hub will provide 24-7 service to its customers and offer gasoline at reasonably low price. Besides, it will provide extensive range of convenience items.

The company's president and CEO Andrew Clyde believes that with the launch of Murphy USA's 1500th store, the company hits another significant milestone toward accomplishing its network expansion goal.

Murphy USA Inks \$645M Acquisition Deal With QuickChek

On Dec 14 Murphy USA has reached an agreement to acquire QuickChek Corporation in an all-cash deal value of \$645 million. The purchase amount comprises estimated tax benefits worth \$20 million for a net after-tax purchase price of \$625 million. The company will pay for the transaction with the help of cash on hand, prevailing credit facilities and new debt. Also, Murphy USA took committed funding from the Royal Bank of Canada.

Valuation

Murphy USA shares are up 10.7% over the trailing 12-month period. Over the past year, the Zacks sub-industry and sector are down 40.5% and 30%, respectively.

The S&P 500 index is up 17.1% in the past year.

The stock is currently trading at 6.24X trailing 12-month EV/EBITDA, which compares to 17.99X for the Zacks sub-industry, 4.89X for the Zacks sector and 16.79X for the S&P 500 index.

Over the past five years, the stock has traded as high as 12.38X and as low as 5.34X, with a 5-year median of 9.06X. Our Neutral recommendation indicates that the stock will perform in-line with the market. Our \$138 price target reflects 0.29X F12M sales.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	A
Growth Score	A
Momentum Score	D
VGM Score	A

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
