Summary

Continued pandemic-led impacts on NuVasive's global elective surgical volumes during the fourth quarter of 2020 are worrying. Contraction in both margins does not bode well. NuVasive's inability to provide any outlook raises apprehensions. Persistent pricing pressure and a poor solvency structure are also concerning. Macroeconomic headwinds and a stiff competition persist. NuVasive's revenues in the fourth quarter were lower-than-expected but earnings were better-than-expected. Yet, continued recovery in the U.S. business is encouraging. Strong international growth also is impressive. Robust product pipeline and the recent Simplify Medical buyout buoy optimism. NuVasive's growing investment in R&D to strengthen its foothold in less invasive surgeries bodes well. Over the past six months, NuVasive has outperformed its industry.

Overview

San Diego, CA-headquartered NuVasive, Inc. is one of the leading global medical device companies in the global spine market, focused on developing minimally-disruptive surgical products and procedurally-integrated solutions for the spine. NuVasive's current product portfolio is focused on applications for spine fusion surgery.

The principal product offering includes a minimally-disruptive surgical platform called Maximum Access Surgery (MAS). The MAS platform combines three categories of solutions that collectively minimize soft tissue disruption during spine fusion surgery, provide maximum visualization and are designed to enable safe and reproducible outcomes for the surgeon and the patient. The platform includes NuVasive's proprietary NVM5 and NVJJB, and Intra-Operative Monitoring (IOM) services and support; MaXcess, an integrated split-blade retractor system and a wide variety of specialized implants and biologics.

The spine surgery product line includes products for the thoracolumbar and the cervical spine. The biologic product line used to aid the spinal fusion process or bone healing process include Osteocel Plus and Osteocel Pro allograft (donated human tissue) which are cellular matrix products containing viable mesenchymal stem cells (or MSCs), as well as other allograft offerings, FormaGraft – a collagen synthetic product and AttraX.

NuVasive acquired Simplify Medical, the maker of cervical total disc replacement in February 2021. Post this buyout, NuVasive now offers cervical artificial disc technology for cervical total disc replacement procedures.

NuVasive also offers IOM services for insight into the nervous system during non-spine procedures. Post the closing of the Ellipse Technologies buyout in 2016, NuVasive has included its business under a newly created division called NuVasive Specialized Orthopedics (NSO).

NuVasive has combined the service offerings of Biotronic with its Impulse Monitoring business to create NuVasive Clinical Services following the Biotronic NeuroNetwork buyout (in 2016). NuVasive fortified the NuVasive Clinical Services' (NCS) position as the largest provider of outsourced IONM services in the United States post the SafePassage buyout (in 2018).

Reasons To Buy:

▲ **Share Price Movement:** Over the past six months, NuVasive has outperformed its industry. The stock has gained 28.8% compared with the industry's 7% rise. NuVasive exited the fourth quarter of 2020 with better-than-expected earnings. Continued recovery in the U.S. business is encouraging. Strong international growth, led by Asia Pacific, is impressive. A robust product pipeline and the recent Simplify Medical buyout buoy optimism. NuVasive's growing investment in R&D to strengthen its foothold in less invasive surgeries bodes well. The huge scope of growth in spine market and a strong potential in NuVasive's international business are added benefits.

NuVasive's huge scope in Spine market, strong international and U.S. sales contributed to the overall growth.

▲ **Huge Scope of Growth in Spine Market:** Per a report by MarketsAndMarkets, the global spinal implants and surgery devices market is projected to reach \$13.8 billion by 2025 from \$10.3 billion in 2019 at a CAGR of 5%. Accordingly, NuVasive is currently leaving no stone unturned to capture this fast-growing spine market.

The company, in February 2021, confirmed that it has planned key launches across all procedural areas in 2021. Few of the planned launches by the company include the commercial launch of Modulus ALIF in the second half of 2021 to drive continued growth in the ALIF market and the upcoming commercial launch of its Reline Cervical or posterior cervical fusion integrated with the Pulse platform.

In November 2020, it unveiled its C360 cervical spine portfolio. It has also commercially launched the Anterior Cervical Plating (ACP) system, which according to NuVasive, is one of its largest commercial introductions.

The company, in November 2020, commercially launched Cohere XLIF, the first Porous PEEK interbody brought to market for use in eXtreme Lateral Interbody Fusion (XLIF) and X360 surgeries. The same month, NuVasive received the FDA's 510(k) clearance for its thoracolumbar interbody portfolio to include the treatment of multi-level sagittal deformities of the thoracolumbar spine.

▲ **Organizational Restructuring Plan Looks Impressive:** In November 2020, NuVasive announced a new organizational and leadership structure for its global commercial operations as well as its product and services organization. These were previously consolidated under the role of the company's president. According to the company, these changes establish a new global commercial leader and bring together NuVasive's product and services teams under a single global leader. This new plan is expected to further advance execution of NuVasive's long-term strategy and growth goals, including doubling International net sales by 2024.

▲ **International Business Holds Potential:** According to NuVasive, the International region holds tremendous growth opportunity for the company. In the quarter, the company registered an uptick of 8% year over year in international revenues on a reported basis and 4.6% rise at constant exchange rate or CER. This resulted from strong contributions from Asia Pacific, which were driven by product launches in the cervical portfolio and lower pandemic-led impacts.

Further, NuVasive's global operations continue to execute well. The company's efforts to address European Medical Device Regulation readiness included a pilot launch of a sterile packaging deployment process and obtaining an important regulatory certification.

The company currently looks forward to continue expanding NuVasive spine, pediatric and specialized orthopedic portfolios in the region.

▲ **U.S. Surgical Support Prospect Strong:** Within the Surgical Support business, NuVasive acquired Safe Passage in 2019. With this acquisition, the company has solidified its leadership position as the largest provider of outsourced intraoperative neurophysiological monitoring services. Per management, the market is gradually experiencing greater adoption and increasing demand for its offering of surgical alternatives with less tissue disruption. NuVasive continues to focus on unique spine offerings. Despite the pandemic-led business debacle, the company witnessed volume improvement throughout the second quarter. Additionally, NuVasive Clinical Services continued to drive business and operational efficiencies during this time.

▲ **New Strategies Buoy Optimism:** NuVasive earlier highlighted four technological focus areas for 2020. These include lateral single-position surgery, surgical intelligence, advanced material science and complex spine, also known as deformity. In this regard, the company is seeing solid adoption of the lateral single-position surgery for short powered by Surgical Intelligence continues. The procedure has been launched internationally, with completed cases in the U.K., Italy and Switzerland.

Reasons To Sell:

▼ **Coronavirus-Led Procedural Deferrals Hurt Sales:** NuVasive's fourth-quarter top line was adversely impacted, which fell by 6.7% at CER, due to pandemic-led impact on elective surgeries. Similarly, U.S. Spinal Hardware business revenues fell 8.1% year over year due to a fall in case volumes as a result of the pandemic. Revenues from the U.S. Surgical Support business, in the fourth quarter, declined 12.9% year over year due to a fall in case volumes in the NuVasive Clinical Services business, along with challenging billing and collections comparisons from the year-ago period. Further, there was a lack in levels of stocking orders within the company's biologics or interoperative neuromonitoring product lines due to the pandemic's resurgence, creating additional pressure in late December.

NuVasive's international performance was impacted in parts of Europe as it continues to be heavily impacted by the pandemic, with the United Kingdom and Spain registering significant year-over-year declines.

Headwinds like margin drag, pricing and payers pressure, reimbursement issues and competitive landscape are major downsides.

▼ **Poor Solvency Structure:** NuVasive exited fourth-quarter 2020 with cash and cash equivalents, and short-term marketable securities of \$1.03 billion compared with \$982 million at the end of the third quarter of 2020. Meanwhile, total debt came up to \$1.42 billion, an increase from the sequentially-last-reported figure of \$1.41 billion. The reported quarter's total debt was much higher than the corresponding cash and cash equivalent, and short-term marketable securities level. However, if we go by the company's current-year debt level of \$645 million, this comes pretty low compared to the cash in hand. This is good news in terms of solvency position of the company, at least during the year of economic downturn, implying that the company is holding sufficient cash for debt repayment.

Debt comparison with the industry is, favorable as industry's total debt of \$10.11 billion, stands much higher to the company's debt level.

The quarter's total debt-to-capital ratio of 60.6% stands at a moderately high level right now. It represents a sequential decline from 61% in the third quarter. This compares unfavorably with the total debt-to-capital ratio of the industry, which stands at a lower level of 37.3%. The overall data concludes that in terms of solvency level of the company, the picture is quite discouraging.

On the other hand, the company's fourth-quarter interest coverage stands at a very low level of 0.3%, down from the sequentially-last quarter's 0.7%. This, also, compares unfavorably with the times interest earned for the industry which stands at a higher level (5.6%).

▼ **Macroeconomic Headwind May Hamper Growth:** Although the market for spine surgery procedures will continue to grow over the long term, this industry is highly susceptible to any change in economic, political and regulatory influences which may slow down the spine market's growth rate. These changes include pricing pressure from the continued consolidation of hospital customers and the expansion of group purchasing organizations, unfavorable third-party payer coverage, reimbursement policies, and new and proposed legislation and regulations designed to contain or reduce the cost of healthcare.

▼ **Pricing Pressure Continues to Persist:** Pricing continues to remain a major headwind for NuVasive as it experiences declining prices for its products due to increasing competition in the spine market; pricing pressure experienced by hospital customers from managed care organizations, insurance providers and other third-party payers; and increased market power of hospital customers as the medical device industry consolidates.

▼ **Tough Competitive Landscape:** The presence of a large number of players has made the medical devices market intensely competitive. The orthopedic industry, in particular, is highly competitive with the presence of bellwethers like Zimmer Holdings, Stryker, Johnson & Johnson's DePuy, Orthofix International N.V., Vyaire Medical (formerly VIASYS Healthcare, a division of Becton, Dickinson and Company) and Medtronic.

Last Earnings Report

NuVasive's Q4 Earnings Top Estimates, Margin Declines

NuVasive's delivered fourth-quarter 2020 adjusted earnings per share of 59 cents, down 19.2% from the year-ago figure. However, the figure beat the Zacks Consensus Estimate by 7.3%.

The one-time adjustments include expenses associated with certain ongoing litigation matters and amortization expenses, among others.

GAAP earnings per share came in at 3 cents, down from the year-ago earnings per share of 55 cents.

Full-year adjusted earnings per share was \$1.23, reflecting a 50.2% decrease from the year-ago period. However, the metric surpassed the Zacks Consensus Estimate by 3.4%.

Total Revenues

Revenues in the fourth quarter totaled \$291.8 million, down 5.9% year over year on a reported basis (down 6.7% at CER). The top line lagged the Zacks Consensus Estimate by 2.2%.

The company registered strong international performance, especially in Asia Pacific, despite pandemic-led headwinds.

Full-year revenues were \$1.05 billion, reflecting a 10.1% plunge from the year-ago period (down 10.2% at CER). Again, the metric lagged the Zacks Consensus Estimate by 0.9%.

Geographical & Segmental Details

In the reported quarter, U.S. Spinal Hardware business revenues fell 8.1% year over year to \$155.2 million. The business was partly boosted by NuVasive's thoracolumbar portfolio which was primarily driven by continued adoption of advanced material science implants. Also, strong results from the clinical evaluation of Modulus ALIF and Reline 3D within the company's pediatric portfolio contributed to the growth. However, this was offset by a fall in case volumes due to the pandemic.

Revenues from the U.S. Surgical Support business were \$67.4 million in the fourth quarter, down 12.9% year over year. The business experienced a decline in case volumes in the NuVasive Clinical Services business along with challenging billing and collections comparisons from the year-ago period. Further, there was a lack in levels of stocking orders within the company's biologics or interoperative neuromonitoring product lines due to the pandemic's resurgence creating additional pressure in late December.

In the quarter, the company registered international revenues of \$69.2 million, reflecting an 8% year-over-year rise on a reported basis and 4.6% rise at CER. This resulted from strong contributions from Asia Pacific, which was driven by product launches in the cervical portfolio and lower impacts from COVID-19. However, parts of Europe continue to be heavily impacted by the pandemic, with the United Kingdom and Spain registering significant year-over-year declines.

Margin Details

In the reported quarter, gross profit declined 8.8% year over year to \$207.2 million. Gross margin contracted 218 basis points (bps) to 70.9%.

Selling, general and administrative expenses declined 10% year over year to \$144.3 million, whereas research and development (R&D) expenses climbed 13.9% year over year to \$21.8 million.

Overall adjusted operating profit was \$41.1 million, down 13.6% year over year. Adjusted operating margin was 14.1%, a 124-bps contraction year over year.

Operational Update

The company exited 2020 with cash and cash equivalents, and short-term marketable securities of \$1.03 million compared with \$213 million at the end of 2019.

Cumulative net cash provided by operating activities at the end of 2020 was \$ 185.9 million compared with the prior-year period's \$235.3 million.

Guidance

NuVasive noted that due to the continued variability stemming from the pandemic, it is not providing any financial guidance for 2021.

Quarter Ending	12/2020
Report Date	Feb 25, 2021
Sales Surprise	-2.25%
EPS Surprise	7.27%
Quarterly EPS	0.59
Annual EPS (TTM)	1.21

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	B
Growth Score	C
Momentum Score	F
VGM Score	B

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Forward-looking statements are subject to certain risks and uncertainties. Any statements that refer to expectations, projections or characterizations of future events or circumstances, including any underlying assumptions, are forward-looking statements. Actual results, performance, or achievements may differ materially from those expressed or implied.

Returns quoted represent past performance which is no guarantee of future results. Investment returns and principal value will fluctuate so that when shares are redeemed, they may be worth more or less than their original cost. Current performance may be higher or lower than the performance shown.

Investing involves risk; principal loss is possible. There is no guarantee that companies that can issue dividends will declare, continue to pay or increase dividends.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
