Summary

Shares of ONEOK have underperformed the industry in the past 12 months. The company's operations are subject to strict regulations and an intense competition in the midstream energy space. Also, it does not own the entire land on which its pipelines are located, which increases the risks of incurring higher expenses to maintain necessary land use. Midstream service space is highly competitive and ONEOK's ability to withstand several challenges will depend on the efficiency, quality and reliability of services it provides. Nevertheless, ONEOK Partners' acquisition gives it a distinct competitive edge and reaps benefits from its fee-based commitments as production volume increases. The gradual ramp-up of production from upstream players and ONEOK's extensive assets in the high-growth region will enable it to fare well.

Overview

Tulsa, OK-based ONEOK Inc. was founded in 1906. The company is an energy company, is engaged in natural gas and natural gas liquids (NGL) businesses. The company was the sole general partner and owner of 41.2% of ONEOK Partners L.P. as of Dec 31, 2016. On Feb 1, 2017, ONEOK and ONEOK Partners entered into a definitive agreement. Per the deal, ONEOK will acquire the remaining 58.8% stake in ONEOK Partners for \$9.3 billion. The transaction was completed on Jun 30, 2017.

ONEOK is primarily focused on rendering management support and resources to ONEOK Partners and creating value for its shareholders through its ownership in the partnership. As a result, ONEOK's reportable segments reflect the three business segments of ONEOK Partners. ONEOK Inc.'s operations are divided into three reportable business segments: **Natural Gas Gathering and Processing, Natural Gas Liquids and Natural Gas Pipelines.**

In 2019, the Natural Gas Gathering and Processing, Natural Gas Liquids and Natural Gas Pipelines segments contributed 21%, 75% and 4% to total revenues, respectively.

The Natural Gas Gathering and Processing segment provides nondiscretionary services to producers that include gathering and processing of natural gas produced from crude oil and natural gas wells. This segment gathers and processes natural gas in the Mid-Continent region.

The Natural Gas Liquids segment owns and operates facilities that gather, fractionate, treat and distribute NGLs and store NGL products, primarily in Oklahoma, Kansas, Texas, New Mexico and the Rocky Mountain region where it provides nondiscretionary services to producers of NGLs.

The Natural Gas Pipelines segment owns and operates regulated natural gas transmission pipelines and natural gas storage facilities. Other and eliminations is a non-operating segment consisting of the operating and leasing operations of the company's headquarters building and related parking facility and other amounts needed to reconcile ONEOK's reportable segments to its consolidated financial statements.

Source: Zacks Investment Research

Reasons To Sell:

▼ Shares of ONEOK have lost 62.2% compared with the industry's decline of 27.6% in the past year. The company's operations are subject to various federal, state and local environmental regulations. The utility regulatory authorities in Oklahoma, Kansas and Texas regulate many aspects of the company's utility operations, including customer service and rates charged to customers. The company's profitability largely depends on its ability to recover costs related to providing energy and other commodities to customers by obtaining the required regulatory approvals. Moreover, ONEOK Inc. expects costs of compliance to be significant.

▼ ONEOK does not own all the land on which its pipelines are situated. The company runs the risks of higher costs related to the necessary land usage. If the company fails to renew existing land rights and add new rights to lay down its pipelines, it will impact operation and profitability of the company.

COVID-19 fear is affecting the whole world and adversely impacting the global economy and lowering the commodity prices. To cope with the declining prices, the E&P companies are lowering their activities in the onshore shale region and as a result the demand for ONEOK services is also going down. The company has suspended few expansion projects and the ongoing decline in demand could hurt profitability in the long run.

▼ The natural gas and natural gas liquids pipeline industries are expected to remain highly competitive. Apart from existing pipeline companies, this midstream section has recently seen many energy companies forming master limited partnerships (MLPs) to begin pipeline services. The partnership's assets are well spread out but its ability to withstand competitive challenges will depend on the efficiency, quality and reliability of the services it provides.

▼ The company's long-term debt was \$14,276.2 million as of Jun 30, 2020 compared with \$12,50479.8 million at the end of fourth-quarter 2019. The metric rose persistently in the past few years. Long-term debt amounted to \$7,920 million at the end of 2016. The company's debt to capital was 69.72% at the end of the second quarter compared with the industry's average of 51.02%. The company incurred interest expenses of \$219 million, up 86.4% from \$117.5 million in the prior-year quarter.

The times interest ratio of the company at end of second quarter was 2.30, which can assure the investors about the ability of the company to meet its debt obligation but this ratio dropped from 3.01 registered at the end of previous quarter. Increasing long-term debt level and lower demand for midstream operation due to the pandemic could compromise the company's ability to service its debt unless demand improves for midstream services.

Stringent government regulations, sluggishness in demand due to COVID-19 outbreak, and intensifying competition in the pipeline business are potential growth deterrents.

Risks

- With production volumes gradually resuming normalcy, ONEOK is poised to benefit from long-term fee-based commitments in its Natural Gas Gathering and Processing and Natural Gas Liquids segments. The company anticipates 90% of its earnings in 2020 to be fee-based. Given the current market conditions, the company expects adjusted earnings before interest, tax, depreciation and amortization (EBITDA) to be at the lower end of the \$2.60-\$3 billion range in 2020. As production volumes continue to improve in its service areas, the company expects to better its performance in the second half of 2020.
- ONEOK continues to invest in organic growth projects to expand existing operating regions and provide a broad range of services to crude oil as well as natural gas producers and end-use markets. In 2019, capital expenditures (less allowance for equity funds used during construction) amounted to \$3.84 billion. The company initially expected to invest in the range of \$2.25-\$2.73 billion in 2020.

However, it reduced its capital expenditure budget for 2020 by \$900 million due to fluctuations in the commodity price market and a decline in the oil and gas production level. Currently, the company anticipates spending in the range of \$300-\$400 million for the second half of 2020 due to a drop in demand for its services from its pre-pandemic levels. Also, it expected to save costs of approximately \$120 million in total for the ongoing year.

- In Natural Gas Gathering and Processing segment, 195 wells were connected in the first half of 2020 at Rocky Mountain. In Mid-Continent, the company's natural gas liquid segment registered 60,000 barrels per day increase in ethane volumes during June compared with first quarter of 2020.

Courtesy of projects completed and its 40,000 miles of NGL and natural gas pipelines in the most prolific U.S. shale basins, the company is well poised to gain traction once production volumes improve further from the present levels. Moreover, no single customer contributes more than 10% to ONEOK's total revenues. In a way, this gives stability to its top line and in fact, the loss of a single customer is not going to affect the company's performance.

- ONEOK Partners is the primary growth vehicle for ONEOK and the completion of acquisition of the remaining interest in ONEOK Partners is going to be accretive to distributable cash flow from 2017 through 2021. ONEOK Partners' financial strength, diversified operations, excellent market connectivity, and systematic investments in organic projects and strategic acquisitions provide ONEOK a distinct competitive advantage.

Last Earnings Report

ONEOK's Earnings Miss Estimates in Q2, Revenues Beat

ONEOK posted second-quarter 2020 operating earnings of 32 cents per share, which missed the Zacks Consensus Estimate of 50 cents by 36%. Also, the bottom line plunged 57.3% on a year-over-year basis.

Due to the negative impact of COVID-19 on demand and prices of crude oil, most E&P companies voluntarily ramped down production volumes. This, in turn, induced weak volumes in ONEOK's pipeline, thereby impacting its results.

Quarter Ending 06/2020

Report Date	Jul 28, 2020
Sales Surprise	1.22%
EPS Surprise	-36.00%
Quarterly EPS	0.32
Annual EPS (TTM)	2.66

Revenue Results

Total revenues of \$1,660.7 million surpassed the Zacks Consensus Estimate of \$1,641 million by 1.2%. However, the top line declined 32.4% from \$2,457.6 million in the prior-year quarter.

Highlights of the Release

The company spent \$940.5 million on cost of sales and fuel, down 42.1% from the year-ago quarter's level.

In the second quarter, ONEOK's adjusted EBITDA were \$533.9 million, down 15.6% year over year.

The company incurred interest expenses of \$219 million, up 86.4% from \$117.5 million in the prior-year quarter.

The company's operating income of \$355.7 million in the second quarter was down 25.3% from \$476.1 million in the prior-year quarter.

Financial Highlights

As of Jun 30, ONEOK had cash and cash equivalents worth \$945.7 million compared with \$21 million as of Dec 31, 2019.

Long-term debt (excluding current maturities) was \$14,276.2 million as of Jun 30, 2020, up from \$12,479.7 million as of Dec 31, 2019.

The company's cash provided by operating activities at the end of the first half of 2020 was \$736.4 million, down from \$968 million at the end of first-half 2019.

Capital expenditures (less allowance for equity funds used during construction) amounted to \$1,544 million at the end of first-half 2020, down from \$1,720.2 million in the same period of 2019.

Guidance

For second-half 2020, ONEOK projects total capital expenditures between \$300 and \$400 million.

Valuation

ONEOK shares are down 64.4% in the year to date period, and 62.2% over the trailing 12-month period. Stocks in the Zacks sub-industry and the Zacks Utility sector was down 29.9% and 14.4% in the year to date period, respectively. Over the past year, the Zacks sub-industry is down 27.6% and sector is down 11.9%.

The S&P 500 index is up 3% in the year to date period and 11.8 % in the past year.

The stock is currently trading at 12.71X of forward 12 months earnings, which compares to 13.90X for the Zacks sub-industry, 12.71X for the Zacks sector and 23.93X for the S&P 500 index.

Over the past five years, the stock has traded as high as 37.06X and as low as 4.05X, with a 5-year median of 22.71X. Our Underperform recommendation indicates that the stock will perform worse than the market. Our \$23 price target reflects 10.86X of forward 12 months earnings.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	A
Growth Score	D
Momentum Score	D
VGM Score	C

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
