Summary

Shares of Prosperity Bancshares have outperformed the industry over the past year. The bank's earnings outpaced the Zacks Consensus Estimate in each of the trailing four quarters. Solid loan and deposit balances, along with the company's strong balance sheet position are likely to continue to support profitability. Further, opportunistic acquisitions are expected to continue supporting financials. Additionally, the company's steady capital deployment actions seem sustainable and will likely continue to enhance shareholder value. However, near-zero interest rates and the Federal Reserve's accommodative policy are expected to put pressure on margins. Moreover, weakness in the mortgage banking business will likely hurt top-line growth to some extent, which is worrisome. Further, mounting expenses remain a matter of concern.

Overview

Houston, TX-based Prosperity Bancshares, Inc. was formed in 1983 as a vehicle to acquire the former Allied Bank in Edna, TX, which was chartered in 1949 as The First National Bank of Edna and is presently known as Prosperity Bank. The financial holding company, pursuant to the Gramm-Leach-Bliley Act, derives substantially all of its revenues and income from its bank subsidiary — *Prosperity Bank*.

Prosperity Bank provides a wide range of financial products and services — traditional loan and deposit products — to small and medium-sized businesses and consumers. The company provides loans to businesses in the range of \$0.1 million to \$8.0 million. As of Jun 30, 2020, Prosperity Bank operated 275 full-service banking centers.

Since its inception, Prosperity Bancshares has been growing considerably through the acquisition of community banks and branches of other banks. Moreover, since 1998, the company has completed more than 30 deals.

The major buyouts include Commercial Bancshares, Inc. in 2001, First Capital Bankers, Inc. in 2005, Texas United Bancshares, Inc. in 2007, Franklin Bank in 2008 and First Bank in 2010. Further, in 2012, Prosperity Bancshares acquired Texas Bankers, Inc., The Bank Arlington, American State Financial Corporation and Bellaire-based Community National Bank.

In 2013, Prosperity Bancshares completed the buyouts of East Texas Financial Services Inc., Coppermark Bancshares, Inc. and FVNB Corp. In 2014, the company acquired F&M Bancorporation Inc., while in 2016 it completed the merger of Tradition Bancshares, Inc. In 2019, the bank completed the acquisition of LegacyTexas Financial Group, Inc.

As of Jun 30, 2020, Prosperity Bancshares had total assets of \$33 billion, cash and due from banks of \$332.9 million, total loans of \$21 billion, total deposits of \$26.2 billion, as well as shareholders' equity of \$5.9 billion.

Source: Zacks Investment Research

Reasons To Buy:

- ▲ Prosperity Bancshares' growth strategy is driven by organic expansion efforts. The company's net revenues witnessed a five-year (2015-2019) CAGR of 2.2%, with the trend continuing in first-half 2020. This upside mainly stemmed from higher loan balance and acquisitions. Further, it has been able to improve the deposit mix, with almost 35% being non-interest-bearing deposits as of Jun 30, 2020. A rise in the demand for loans will likely continue to support revenues in the upcoming quarters.
- ▲ Acquisitions remain one of the major contributors to Prosperity Bancshares' growth. Over the years, the company has significantly expanded its operations through the buyout of community banks and branches of other banks. Since 1998, it has completed more than 30 deals. In November 2019, the bank acquired LegacyTexas Financial, which will be accretive to earnings in the upcoming quarters. Given a strong balance sheet position, the company is likely to continue with the expansion strategy.
- ▲ As of Jun 30, 2020, Prosperity Bancshares had total debt of \$593.8 million, and cash and cash equivalents worth \$332.9 million. During second-quarter 2020, the company significantly lowered debt burden. Its other borrowings were down 92.2% sequentially. Further, its times interest earned — which was 25.8X at second quarter-end — has been improving over the last several quarters. This implies that the company's earnings are likely to be sufficient to meet interest and/or debt obligations if the economic situation worsens.
- ▲ We remain encouraged by Prosperity Bancshares' steady capital deployment activities. The company has been consistently increasing its dividend annually since 1999, with the last hike announced in October 2019. Further, in January, it had announced a share repurchase program (expiring in January 2021) to buy back up to nearly 4.7 million shares. Given the company's strong balance sheet position and solid earnings strength, capital deployment activities are projected to remain sustainable.
- ▲ Shares of Prosperity Bancshares have outperformed the industry over the past year. Moreover, the company's 2020 earnings estimates have been revised 1.1% upward over the past 30 days. Further, the stock seems undervalued than the broader industry. Its current price/earnings (F1) and PEG ratios are below the respective industry averages. It has a Value Score of B. Therefore, given the strong fundamentals and positive estimate revisions, the stock has decent upside potential.

Inorganic expansion efforts, higher loan balance and a solid balance sheet position will aid Prosperity Bancshares' profits. Further, the bank's capital deployment actions are impressive.

Reasons To Sell:

- ▼ Prosperity Bancshares' net interest margin (NIM) continues to remain under pressure. Though NIM increased to 3.32% in 2019, it has been persistently declining over the past several years — 3.18% in 2018, 3.19% in 2017, 3.35% in 2016, 3.38% in 2015 and 3.80% in 2014. The company's NIM is expected to remain under pressure owing to near-zero interest rates.
- ▼ Rising non-interest expenses remain a concern for Prosperity Bancshares. Expenses witnessed a four-year CAGR of 6% (ended 2019). The uptrend persisted in the first six months of 2020. The increase was mainly due to higher salaries and benefits expenses. The same trend expected to continue in the quarters ahead as the company continues to invest in franchises and grow through acquisitions.
- ▼ Weak performance of the mortgage banking business is a big cause of concern for Prosperity Bancshares. Though mortgage income grew in 2019, the majority of it came in the last quarter owing to lower rates and improving consumer sentiments. For second-quarter 2020, the same declined on a sequential basis despite historically low mortgage rates. Dismal mortgage performance is likely to continue in the near term, as the operating backdrop is not expected to change much.

Pressure on margins amid lower interest rates is a major concern for Prosperity Bancshares. Further, mounting operating expenses and weakness in the mortgage business are expected to hurt profitability.

Last Earnings Report

Prosperity Bancshares Q2 Earnings Beat, Revenues Down Y/Y

Prosperity Bancshares Inc.'s second-quarter 2020 adjusted earnings per share of \$1.25 surpassed the Zacks Consensus Estimate of \$1.09. However, the bottom line decreased 10.1% from the first quarter.

The results were primarily driven by an increase in net interest income. The company's balance sheet position remained strong during the quarter. However, higher expenses, decline in fee income and a drastic jump in provision for credit losses were the undermining factors.

After considering merger-related charges and income tax benefit, net income available to common shareholders was \$130.9 million, which was relatively stable on a sequential basis.

Revenues Down, Expenses Rise

Net revenues were \$284.6 million, down 2% from the prior quarter. Nonetheless, the figure beat the Zacks Consensus Estimate of \$279 million.

Net interest income was \$259 million, up 1.1% from the first quarter. The increase was primarily driven by lower interest expense, partially offset by a decrease in loan discount accretion and interest income on securities.

Net interest margin, on a tax-equivalent basis, declined 12 basis points (bps) sequentially to 3.69%.

Non-interest income plunged 25.3% year over year to \$25.7 million. The fall was mainly due to a loss on write-down of assets and decrease in NSF fees.

Non-interest expenses increased 7.7% from the first quarter to \$134.4 million. The increase was largely due to merger-related expenses, and salaries and benefits costs.

As of Jun 30, 2020, total loans were \$21 billion, up 9.9% from first quarter-end. Total deposits rose 9.8% sequentially to \$26.2 billion.

Credit Quality Worsens

Provision for credit losses was \$10 million compared with no provisions in first-quarter 2020. Net charge-offs were \$13 million, up substantially from \$0.8 million in the first quarter.

As of Jun 30, 2020, total non-performing assets were \$77.9 million, which increased 15.9% sequentially. However, the ratio of allowance for credit losses to total loans was 1.54%, down 17 bps from the first quarter.

Capital Ratios Improve, Profitability Ratios Worsen

As of Jun 30, 2020, Tier-1 risk-based capital ratio was 12.29%, up from 12.27% on Mar 31, 2020. Moreover, total risk-based capital ratio was 13.36% compared with 12.27% at first quarter-end.

The annualized return on average assets was 1.61%, down from 1.67% at first quarter-end. Annualized return on common equity was 8.84% compared with 8.86% in the first quarter.

Share Repurchase Update

During the quarter, the company did not repurchase any shares.

Outlook

For the third quarter 2020, core NIM is expected to be relatively stable, given the current economic conditions, with some additional pressure owing to loan repricing.

Non-interest expenses are anticipated within \$118-\$119 million. This excludes additional cost savings of nearly \$7-\$9 million per quarter from the LegacyTexas Financial acquisition.

Quarter Ending	06/2020
Report Date	Jul 29, 2020
Sales Surprise	2.00%
EPS Surprise	10.62%
Quarterly EPS	1.25
Annual EPS (TTM)	5.27

Recent News

Dividend Update

On Jul 29, Prosperity Bancshares announced a cash dividend of 46 cents per share. The dividend will be paid on Oct 1 to shareholders of record as of Sep 15.

Valuation

Prosperity Bancshares' shares are down 24.4% in the year-to-date period and 14.9% over the trailing 12-month period. Stocks in the Zacks sub-industry and the Zacks Finance sector are down 27.9% and 14.9% in the year-to-date period, respectively. Over the past year, the Zacks sub-industry and the sector are down 15.7% and 6.2%, respectively.

The S&P 500 index is up 3.7% in the year-to-date period and 14% in the past year.

The stock is currently trading at 10.71X forward 12 months earnings, which compares to 13.09X for the Zacks sub-industry, 16.75X for the Zacks sector and 23.18X for the S&P 500 index.

Over the past five years, the stock has traded as high as 18.76X and as low as 8.19X, with a 5-year median of 13.93X. Our Neutral recommendation indicates that the stock will perform in line with the market. Our \$58 price target reflects 11.42X forward earnings.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	B
Growth Score	C
Momentum Score	B
VGM Score	B

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
