Summary

Progressive continues to gain on higher premiums, given its compelling product portfolio, leadership position and strength in both Vehicle and Property businesses. Focus on becoming a one-stop insurance destination, catering to customers opting for a combination of home and auto insurance, augurs well for growth. Policies in force and retention ratio should remain healthy. Competitive pricing to retain current customers and address customer needs with new offerings should continue to drive policy life expectancy. Shares of Progressive have underperformed the industry in a year. However, exposure to cat induces underwriting volatility. Escalating expenses due to higher losses and settlement expenses remain an overhang on margin. High debt level along with low times earned interest pose financial risk. Its fourth-quarter earnings beat estimates.

Overview

Based in Mayfield Village, OH, The Progressive Corporation is one of the major auto insurers in the country. Founded in 1965, Progressive is a leading independent agency writer of private passenger auto coverage, and the market share leader for the motorcycle products since 1998. Progressive operates through three business segments.

- The **Personal Lines** (83.1% of 2020 Net Premium earned) segment writes insurance for private passenger automobiles, recreational and other vehicles. This business generally offers more than one program in a single state, with each program targeted toward a specific distribution channel, market, or customer group. Personal Lines products comprise insurance for personal autos and special lines products. The agency business includes business written by Progressive's network of more than 35,000 independent insurance agencies located throughout the United States, as well as brokerages in New York and California and strategic alliance business relationships (other insurance companies, financial institutions, and national agencies). The direct business includes business written directly by the company online and over the phone.
- The **Commercial Lines** (12.4%) segment writes primary liability and physical damage insurance for automobiles and trucks owned by small businesses. The majority of its Commercial Auto customers insure two or fewer vehicles. The Commercial Lines business, which is primarily distributed through the independent agency channel, operates in the business auto and specialty truck markets. The business auto market accounts for one third of its total Commercial Auto premiums and approximately 60% of the vehicles Progressive insures in this business. The remainder is in the specialty truck commercial auto market, which includes dump trucks, logging trucks, tow trucks, local cartage and other short-haul commercial vehicles.
- The **Property (4.5%)** segment writes personal property insurance, for homeowners, other property owners, and renters, in the Agency channel in over 31 states and the District of Columbia for personal property insurance and in over four states for commercial property insurance.

Source: Zacks Investment Research

Reasons To Buy:

- ▲ Shares of Progressive have gained 32.5% in a year, underperforming industry's increase of 35.4%. We expect improving operating revenues, continued premium growth and robust capital position to drive the stock higher in the future.
- ▲ Progressive is seen as a leader in product, service and distribution innovation, especially in personal auto. It is also a leader in underwriting technology and application of quantitative analytics in pricing and risk selection. The company's rates are very competitive in all its markets and it continues to gain from its expanded multi-product offering. Net premiums written continue to exhibit an upward trend. In 2020, net premiums written increased 8% year over year. We expect this momentum to continue, given its compelling product portfolio. Both its Vehicle and Property businesses continue to exhibit considerable strength with premiums registering growth in both its Personal and Commercial business lines.
- ▲ Management continues to focus on customer retention. Policy life expectancy (PLE), a measure for customer retention, has been exhibiting improvement over the last few years across all its business lines. The company has several initiatives underway aimed at providing consumers with distinctive new auto insurance options. The fastest personal auto growth area continues to be Internet-produced business. Also, Progressive's Snapshot programs, and commercial auto coverage should continue to drive growth. Moreover, this auto insurer remains well poised to gain from declining claims amid a reduction in the number of vehicles plying on roads due to the COVID-19 pandemic. The reduction in travel has led to lower claims, which bodes well for Progressive. We expect the company to continue reporting higher PLE in the coming quarters due to emphasis on competitive pricing to retain current customers and address customer needs with new offerings.
- ▲ Over the past 10 years (2010-2020), the company's combined ratio has averaged less than 93%, which compares favorably with the industry average combined ratio of more than 100%. A combined ratio below 100% signifies underwriting profitability. The company's combined ratio shows that it has been able to maintain its profitability better than the industry. Combined ratio improved 320 basis points to 87.2 in 2020.
- ▲ Progressive has been consistently putting in efforts to further penetrate customer households through cross-selling auto policies and Progressive Home Advantage (PHA). Growth momentum at Progressive's Robinson (bundled home and auto) continued with policies in force growth of about 30%. The acquisition of ARX Holding Corp in April 2020 will complement the company's effort to reach and grow its bundled auto and home Robinsons consumer segment. Going forward, we expect Progressive to make further acquisitions, thereby enhancing its bundling strategy.

Progressive's growth is likely to be aided by an expanded multi-product lineup, solid policies in force, competitive rates and leadership position in product, service and distribution innovation.

Reasons To Sell:

- ▼ Being a property and casualty insurer, Progressive has been exposed to catastrophe loss, which renders volatility to its underwriting results and affected the combined ratio as well. A low interest rate environment in the United States due to the COVID-19 pandemic is adding to the insurer's woes as it is likely to keep margins under pressure.
- ▼ Progressive has been experiencing increasing expenses primarily due to higher losses and loss adjustment expenses, policy acquisition costs, service expense and interest expense. Expenses in 2020 too increased 5% over 2019. Therefore, the company should strive to achieve revenue growth higher than the rate of increase in expenses. Otherwise, expenses will tend to weigh on operating margin expansion.
- ▼ Progressive's high debt levels have added to the insurer's woes. As of Dec 31, 2020, the company's debt level increased 22.4% year over year. However, the leverage ratio improved 30 basis points to 24.1 but compared unfavorably with industry average of 20.6.
- ▼ Valuation remains stretched at current level. Looking at the company's price-to-book ratio, the best multiple for valuing insurers, investors might not want to pay any further premium. The company currently trading at 3.26x trailing 12-month book value, which compares to 1.23x for the industry.

Progressive's exposure to catastrophe loss inducing underwriting volatility, increasing expenses weighing on margin expansion and intensifying competition challenging growth are concerns.

Last Earnings Report

Progressive Q4 Earnings Top, Premiums Earned Up Y/Y

The Progressive Corporation's fourth-quarter 2020 earnings per share of \$1.83 beat the Zacks Consensus Estimate of \$1.68. Moreover, the bottom line increased 1.1% from the year-ago quarter.

Behind the Headlines

Net premiums written were \$9.5 billion in the quarter, down 1% from \$9.6 billion a year ago. Net premiums earned grew 3% to nearly \$10.2 billion.

Net realized gains on securities were \$760.2 million, which more than doubled year over year.

Combined ratio — percentage of premiums paid out as claims and expenses — improved 400 basis points (bps) from the prior-year quarter to 88.

Revenues and Expenses Down In December

Operating revenues in December were \$3.3 million, down 10.7% year over year. The decline can be attributed to a 10.7% decrease in premiums, 8.1% decline in fees and other revenues, 4.3% lower service revenues and 14.6% lower investment income.

Total expenses decreased 17.9% year over year to \$2.8 billion in December due to 21.6% lower losses and loss adjustment expenses, 9.3% lower other underwriting expenses, and 6.8% decrease in policy acquisition costs. Expenses also include \$10.4 million in policyholder credit costs.

In December, policies in force were impressive at the Personal Auto segment, having improved 11% from the year-ago month to 16.5 million. Special Lines improved 8% to 4.9 million.

In Progressive's Personal Auto segment, Direct Auto grew 9% year over year to 7.6 million while Agency Auto improved 13% to 8.9 million.

Progressive's Commercial Auto segment rose 9% year over year to 0.8 million. The Property business had about 2.5 million policies in force in September, up 13%.

Financial Update

Progressive's book value per share was \$28.27 as of Dec 31, 2020, up 24.5% from \$22.54 on Dec 31, 2019.

Return-on-equity in December 2020 was 39.3%, up 430 bps year over year. Debt-to-total capital ratio improved 30 bps to 24.1%.

Quarter Ending 12/2020

Report Date	Jan 27, 2021
Sales Surprise	-6.15%
EPS Surprise	8.93%
Quarterly EPS	1.83
Annual EPS (TTM)	7.45

Recent News

Progressive Declares Quarterly Dividend — Mar 5, 2021

The board of directors of Progressive declared a quarterly dividend of 10 cents per share. The dividend will be paid out on Apr 15 to shareholders of record as of Apr 7.

Progressive January Earnings & Revenues Increase Y/Y - Feb 17, 2021

The Progressive Corporation reported earnings per share of 95 cents for January 2021, which soared 82% year over year. The upside is attributable to improved top line and combined ratio as well as net realized gains on securities. Progressive recorded net premiums written of \$4.1 billion in the month, up 14% from \$3.6 billion in the year-ago month. Net premiums earned were \$3.9 billion, up 10% from \$3.6 billion reported last January. Net realized gains on securities in the months were \$108.2 million, which increased to nearly three-fold year over year.

Progressive Inks Deal to Acquire Protective Insurance - Feb 16, 2021

The Progressive has inked a deal to acquire Protective Insurance Corporation for \$338 million in cash. The acquisition is expected to boost Progressive's Commercial Lines product portfolio with additional product lines, and strengthen its capabilities. The deal is expected to enhance workers' compensation coverage for the transportation industry, which accounts for a major portion of Commercial Lines premiums growth. The buyout will also enable the insurer to meet the requirements of commercial customers.

Valuation

Progressive shares are down 6.7% in the year-to-date period but up 32.5% over the trailing 12-month period. Stocks in the Zacks sub-industry and the Zacks Finance sector are up 10.4% and 9.9% in the year-to-date period, respectively. Over the past year, the Zacks sub-industry and sector are up 35.4% and 51.7%, respectively.

The S&P 500 index are up 3.6% in the year-to-date period and 58.9% in the past year.

The stock is currently trading at 3.26x forward 12-months book value, which compares to 1.23x for the Zacks sub-industry, 3.13x for the Zacks sector and 6.56x for the S&P 500 index.

Over the past five years, the stock has traded as high as 4.19x and as low as 2.22x, with a 5-year median of 3.23x. Our Neutral recommendation indicates that the stock will perform in-line with the market. Our \$95 price target reflects 3.43x book value.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	A
Growth Score	D
Momentum Score	D
VGM Score	C

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
