Summary

Republic Services is focused on increasing its operational efficiency by shifting to compressed natural gas collection vehicles and converting rear-loading trucks to automated-side loaders to reduce costs and improve profitability. The company continues to grow internally with the help of long-term contracts for collection, recycling and disposal of solid waste materials. Consistency in dividend payments and share buybacks not only boost investors' confidence, but also positively impact earnings per share. Partly due to these positives, shares of Republic Services have increased in the past year. On the flip side, the company's operation in a highly-competitive solid waste industry is a concern. High debt may limit the company's future expansion and worsen its risk profile. Seasonality continues to act as a major headwind.

Overview

Republic Services is the second largest provider of non-hazardous solid waste collection, transfer, disposal, recycling, and energy services in the United States. As of Dec 31, 2020, the company operated facilities in 41 states and Puerto Rico through 345 collection operations, 220 transfer stations, 186 active landfills, 76 recycling processing centers, seven treatment, recovery and disposal facilities, 9 salt water disposal wells. The company is engaged in 75 landfill gas-to-energy and renewable energy projects and had post-closure responsibility for 128 closed landfills. The was incorporated in Delaware in 1996.

The company generates revenues mainly from its solid waste collection operations. The remaining revenue comes from other services, which includes transfer station, landfill disposal, recycling, and energy services.

Collection Services unit (75% of 2020 revenues) provides commercial, residential, industrial and other services. Residential collection operations are performed under contracts with municipalities and include collection of refuse from containers into collection vehicles and dumped to transfer stations or landfills. On the commercial and industrial side, the company supplies its customers with waste containers and rents compactors to large waste generators.

Transfer Services unit (6%) deposits waste at its transfer stations. Transfer stations provide collection operations in a cost effective manner to consolidate waste and reduce transportation costs. Revenues are generated by charging extras or disposal fees. The company owns or operates 207 transfer stations.

Landfill Services revenues (13%) are generated from tipping fees charged to third parties. Landfill unit undertakes highly-engineered systems with several layers of environmental protection to increase their overall energy output. The company owns or operates 190 active landfills.

Recycling Services revenues (3%) are generated through the processing and sale of old corrugated containers (OCC), old newsprint (ONP), aluminum, glass and other materials. The company owns or operates 91 recycling processing centers.

Environmental Services (2%) activity varies across market areas depending on the natural resource basins in which the drilling activity occurs and reflects the regulatory environment, pricing and disposal alternatives available in any given market.

Reasons To Buy:

- ▲ The waste management industry stands to benefit from the current scenario as **proper disposal of used masks, gloves, suits, syringes and other medical equipment is of utmost importance to curb the spread of coronavirus**. Government initiatives as well as stringent rules and regulations to advance sustainable waste management mechanisms and put a check on illegal dumping are also expected to boost the industry. Rising environmental concerns, rapid industrialization, increase in population and an expected increase in non-hazardous waste as a result of rapid economic growth should enhance business opportunities for waste management companies. Growing adoption of recycling techniques, development of technologies and advanced waste collection solutions are key trends within the industry. Recycling remains a major growth area, with most industry players undertaking municipal solid waste and non-hazardous industrial waste recycling measures. Per a report by statista, the global waste management market is expected to reach \$530 billion by 2025 from \$330.6 billion in 2017, witnessing a CAGR of 6% from 2018 to 2025. All these factors bode well for Republic Services.
- ▲ Republic Services is focused on increasing its **operational efficiency** by shifting to compressed natural gas (CNG) collection vehicles and converting rear-loading trucks to automated-side loaders, which will reduce cost and improve profitability. The company is focused on enhancing its operations by streamlining the cost structure, improving revenue quality and seeking growth through profitable investment opportunities. In 2020, almost 13% of the replacement vehicle purchases were CNG vehicles. Meanwhile, the company is highly optimistic about the usage of CNG vehicles, which will help it compete effectively on grounds of maintaining a clean environment. Despite higher expenses, CNG reduces the company's overall fleet operating costs through lower fuel expenses. As of Dec 31, 2020, Republic Services operated 38 CNG fueling stations. All these factors offer a solid investment proposition for the company.
- ▲ We are impressed with Republic Services' consistent efforts in rewarding its shareholders through **dividend payments and share repurchases**. In 2020, 2019 and 2018, the company paid \$522.5 million, \$491.2 million and \$461.8 million in dividends and repurchased shares worth \$98.8 million, \$399.4 million and \$736.9 million, respectively. Such moves indicate the company's commitment to create value for shareholders and underline its confidence in its business. These initiatives not only instill investors' confidence but also positively impact earnings per share. This might have aided the company's shares, which has gained 21.1% in the past year.

Efforts to improve operational efficiency boost Republic Services.

Reasons To Sell:

- ▼ Republic Services operates in a **highly competitive solid waste industry**. Large national waste management companies, multiple municipalities and several other regional and smaller companies gives tough competition to the company. Municipalities are particularly a threat to the company's market share as these maintain their own waste collection and disposal activities and benefit from the availability of tax revenues and tax-exempt financing. Price increase and profitability expansion becomes difficult under such a fierce competitive situation.
- ▼ Republic Services' **revenues are highly seasonal in nature** with comparatively lower revenues in the fourth and first quarter, as against the second and third quarters. This is mainly due to lower volume of solid waste generated during winter, owing to lesser construction and demolition activities. Severe cold weather conditions further result in a slowdown in waste collection and disposal activities. All these seasonal factors lower revenue generation and increase operating risks.
- ▼ Republic Services' cash and cash equivalent balance of \$23.2 million at the end of first-quarter 2021 was well below the long-term debt level of \$8.59 billion underscoring that the company **doesn't have enough cash to meet this debt burden**. Further, the cash level can't meet the short-term debt of \$168 million.

Stiff competition, seasonality and high debt weigh on Republic Services' prospects.

Last Earnings Report

Republic Services Q1 Earnings Top Estimates, Revenues Miss

Republic Services reported mixed first-quarter 2021 results wherein earnings surpassed the Zacks Consensus Estimate but revenues missed the same.

Adjusted earnings per share of 93 cents outpaced the consensus mark by 8.1% and improved year over year.

Republic Services continued to convert CPI-based contracts to more favorable pricing mechanisms for annual price adjustment during the quarter. It now has roughly \$931 million in annual revenues, or 37% of nearly \$2.5-billion CPI-based book of business. The company's average recycled-commodity price per ton sold in the first quarter was \$133, reflecting a sequential increase of \$23 per ton and year-over-year increase of \$57 per ton.

Quarter Ending 03/2021

Report Date	May 05, 2021
Sales Surprise	-0.62%
EPS Surprise	8.14%
Quarterly EPS	0.93
Annual EPS (TTM)	3.74

Revenues

Quarterly revenues of \$2.59 billion lagged the consensus estimate by 0.6% but increased 1.7% year over year. The company's top line includes a favorable impact of 0.7% from internal growth and 1% from acquisitions.

Revenues in the **Collection** segment totaled \$1.96 billion, up 0.9% year over year. **Transfer** segment revenues of \$146.2 million increased 7.3% year over year. **Landfill** segment revenues of \$313.3 million increased 2.4% year over year. **Environmental** services segment revenues of \$30 million declined 35.9% year over year. Other segment revenues of \$149 million grew 18.3% year over year.

Operating Results

Adjusted EBITDA margin of 30.7% improved 270 basis points (bps) from the prior-year quarter.

Operating income was \$492.4 million, up 13.7% from the year-ago quarter. Operating margin rose to 18.9% from 16.9% in the year-ago quarter.

Total selling, general and administrative expenses were \$265.4 million, declining 4.2% from the year-ago quarter.

Balance Sheet and Cash Flow

Republic Services exited first-quarter 2021 with cash and cash equivalents of \$23.2 million compared with \$38.2 million at the end of the prior quarter. Long-term debt was \$8.59 billion, flat sequentially.

The company generated \$661 million of cash from operating activities in the reported quarter. Adjusted free cash flow was \$464.2 million.

Dividend Payout

In January 2021, the company paid out \$135.5 million of cash dividend to shareholders on record as of Jan 4, 2021. As of Mar 31, 2021, the company's quarterly payable dividend to shareholders was \$135.6 million on record as of Apr 1, 2021. The dividend was paid out on Apr 15, 2021.

The company's board of directors declared a regular quarterly dividend of 42.5 cents per share for shareholders on record as of Jul 1, 2021. The dividend will be paid out on Jul 15, 2021.

Share Repurchase Activity

During the reported quarter, the company repurchased 0.1 million shares for \$12.7 million. As of Mar 31, 2021, the company had \$2 billion available under its October 2020 repurchase program.

2021 Guidance

Republic raised its full-year adjusted diluted EPS and adjusted free cash flow guidance. Adjusted EPS is now expected between \$3.74 and \$3.79, compared with the prior-guided range of \$3.65-\$3.73. The company now expects to generate \$1.35 billion to \$1.40 billion of adjusted free cash flow compared with the prior guidance of \$1.30 billion to \$1.375 billion.

Recent News

On **Mar 30, 2021**, Republic Services announced that Donald W. Slager forwarded his notice to retire from the company after serving as its chief executive officer (CEO) for more than a decade. President Jon Vander Ark will succeed Slager as the company's CEO. The transition will be effective from Jun 25, 2021.

On **Mar 26, 2021**, Republic Services announced that healthcare industry executive Brian S. Tyler, has been appointed to its board of directors. He will serve on the audit committee as well as the sustainability & corporate responsibility committee.

Valuation

Republic Services shares are up 13.1% in the year-to-date period and 21.1% in the trailing 12-month period. Stocks in the Zacks sub-industry and the Zacks Business Services sector are up 15.9% and 0.7% in the year-to-date period, respectively. In the past year, the Zacks sub-industry gained 22.8%, while those in the sector lost 1.4%.

The S&P 500 index is up 12.7% in the year-to-date period and 34.1% in the past year.

The stock is currently trading at trailing 12-month EV/EBITDA of 13.9X, which compares to 12.89X for the Zacks sub-industry, 15.11X for the Zacks sector and 17.25X for the S&P 500 index.

Over the past five years, the stock has traded as high as 14.22X and as low as 9.02X, with a 5-year median of 12.16X. Our Neutral recommendation indicates that the stock will perform in-line with the market. Our \$115.00 price target reflects 29X forward 12-month earnings.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	B
Growth Score	B
Momentum Score	B
VGM Score	A

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
