Summary

Shares of Truist Financial, formed following the BB&T-SunTrust merger, have outperformed the industry over the past six months. Its earnings have surpassed the Zacks Consensus Estimate in each of the trailing four quarters. Decent loan demand, a strong balance sheet position and focus on non-interest income growth are expected to continue supporting profitability in the quarters ahead. Moreover, given a solid liquidity position, the company is expected to sustain current capital deployment activities. However, near-zero interest rates are expected to continue to hurt margins in the near term, thereby adversely impacting revenue growth. Ambiguity over the impact of coronavirus pandemic on the economy makes us apprehensive. Further, mounting expenses, mainly due to a rise in merger-related costs, are expected to hurt the bottom line to an extent.

Overview

Truist Financial, formed following the 'merger of equals' deal between BB&T Corp and SunTrust Banks, is the sixth largest bank in the United States. The company — headquartered in Charlotte, NC — conducts business operations primarily through its bank subsidiary, Truist Bank, and few other non-bank subsidiaries.

Truist Bank — through more than 2,880 banking offices and 4,237 automated telling machines (ATMs) — offers a variety of services to consumer and commercial clients.

Truist Financial has the following three operating segments:

- **Consumer Banking and Wealth (CB&W)** comprises five primary operations - Retail Community Banking, NCF&P, Wealth, Mortgage Banking and Dealer Retail Services.
- **Corporate and Commercial Banking (C&CB)** is made up of four primary businesses - Corporate and Investment Banking, Commercial Community Banking, Commercial Real Estate, and Grandbridge Real Estate Capital, LLC and Treasury Solutions product group.
- **Insurance Holdings (IH)** provides property and casualty, employee benefits, life insurance surety coverage, as well as title insurance. Also, the segment offers commercial and retail insurance premium finance.

Others, Treasury & Corporate includes Truist Financial's investment securities portfolio, long-term debt, derivative instruments used for balance sheet hedging, short-term liquidity and funding activities, balance sheet risk management, as well as most real estate assets. The company's functional activities such as marketing, finance, enterprise risk, legal, enterprise technology and executive leadership, among others, are also part of this unit.

As of Sep 30, 2020, Truist Financial's total assets were \$499.2 billion, total loans and leases were \$312.1 billion, deposits totaled \$370.7 billion and total shareholders' equity was \$70 billion.

Source: Zacks Investment Research

Reasons To Buy:

- ▲ Truist Financial, formed following the 'merger of equals' deal between BB&T and SunTrust Banks, is the sixth largest bank in the United States. Legacy BB&T relied extensively on acquisitions to grow and expand footprints. Over the years, these transactions have resulted in cost and revenue synergies. Such strategic initiatives will likely continue to support bottom-line growth in the upcoming quarters. Further, management is open for strategic "bolt-on acquisitions with fee income businesses." Notably, recently, the company sold its institutional 401(k) investment advisory services business to OneDigital Investment Advisors and agreed to sell its institutional 401(k) recordkeeping businesses to Ascensus and Empower Retirement.
- ▲ Truist Financial has been recording a rise in net interest income (NII) despite lower rates. NII in 2019 and first nine month of 2020 increased on the back of decent loan demand. Though there has been a fall in demand for loans amid coronavirus-related economic slowdown, the same is expected to gradually pick up once the business activities resume full-fledged. Thus, this is likely to support NII in the upcoming quarters.
- ▲ Truist Financial remains focused on growth of non-interest revenue sources. Fee income grew in 2019 and in the first nine months of 2020. With near-zero interest rates and lower mortgage rates, a rise in origination volume and higher refinancing activities are being witnessed. Further, strength in investment banking and insurance income will accelerate non-interest income growth in the quarters ahead.
- ▲ As of Sep 30, 2020, Truist Financial had total debt worth \$47.3 billion, and cash and due from banks totaled \$4.2 billion. The bank has nominal debt maturities in the near term. Further, its times-interest earned — which was 5.5 at third quarter-end — improved sequentially. Thus, the company will likely be able to meet near-term debt obligations, even if the economic situation worsens.
- ▲ Amid the coronavirus-induced economic slowdown, the Federal Reserve had restricted dividends and share repurchases by major banks in order to conserve liquidity. So, Truist Financial will continue paying the current dividend of 45 cents per share and not resume buybacks till December 2020-end. Nevertheless, following the Fed's second round of stress test and subsequent approval, now the company has authorized to repurchase shares worth up to \$2 billion beginning 2021. Thus, given the solid balance sheet position, debt/equity ratio lower than the industry and earnings strength, the bank is expected to be able to sustain capital deployment activities in the future.
- ▲ Truist Financial's shares have outperformed the industry over the past year. The company's earnings estimates for 2020 have been revised 1.1% upward over the past 30 days. Further, the stock seems undervalued than the broader industry. Its current PEG and price/book ratios are below the respective industry averages. Thus, given the strong fundamentals and positive estimate revisions, the stock has decent upside potential left.

Decent loan demand and efforts to improve fee income are likely to continue supporting Truist Financial's prospects. Further, its steady capital deployments indicate a solid balance sheet position.

Reasons To Sell:

- ▼ Owing to the near-zero interest rates and the Federal Reserve indicating no change in the same till 2023, Truist Financial is expected to continue witnessing pressure on net interest margin (NIM). After recording an improving trend over the last several years, NIM contracted to 3.42% in 2019 from 3.46% in 2018. The fall was mainly due to flattening/inversion of the yield curve and lower interest rates. The trend persisted in the first nine months of 2020.
- ▼ Truist Financial has been witnessing a persistent rise in total operating expenses. The company recorded a compound annual growth rate (CAGR) of 6.1% over the last five years (2015-2019). The increase was mainly due to a rise in personnel expenses and its efforts to improve digitization. The uptrend continued in first three quarters of 2020, largely owing to the merger deal. Expenses are likely to remain elevated, primarily owing to investments in technology upgrades and merger integration.
- ▼ Truist Financial's trailing 12-month return on equity (ROE) undercuts its growth potential. The company's ROE of 7.76% compares unfavorably with 15.20% for the S&P 500. This reflects that the company is less efficient in using shareholders' funds.

Pressure in margins due to lower rates will likely hamper Truist Financial's top-line growth. Moreover, rising expenses, mainly due to higher merger-related charges, might hurt the bottom line.

Last Earnings Report

Truist Financial Q3 Earnings Beat, Provisions Decline

Truist Financial's third-quarter 2020 adjusted earnings of 97 cents per share surpassed the Zacks Consensus Estimate of 88 cents. Results excluded restructuring charges and BB&T-SunTrust Banks merger-related charges, incremental operating expenses related to the merger, securities gains and charges related to a charitable contribution. Compared to the previous quarter, adjusted earnings improved 18.3%.

Results benefited from a decline in expenses along with lower provision for credit losses, partly offset by a fall in revenues. Moreover, the balance sheet position remained strong in the reported quarter.

After considering non-recurring items, net income available to common shareholders (GAAP basis) was \$1.07 billion or 79 cents per share, up from \$902 million or 67 cents per share in the prior quarter.

Revenues & Expenses Decline

Total revenues (on a tax-equivalent basis) were \$5.60 billion, down 5.1% sequentially. However, the figure beat the Zacks Consensus Estimate of \$5.39 billion.

Tax-equivalent NII declined 2.5% from the prior quarter to \$3.39 billion.

NIM decreased 3 basis points (bps) sequentially to 3.10%. The decline was due to lower purchase-accounting accretion, lower yields on loans due to LIBOR changes and lower yield on securities due to the impact of new investments at lower rates.

Non-interest income declined 8.8% sequentially to \$2.21 billion. Notably, in the reported quarter, the company recorded \$104 million worth of securities gains compared with \$300 million recorded in the prior quarter.

Non-interest expenses were \$3.76 billion, down 3.2% from the prior quarter.

Adjusted efficiency ratio was 57.3%, up from 55.8% in the second quarter. A rise in efficiency ratio indicates a fall in profitability.

As of Sep 30, 2020, total average deposits were \$372.21 billion, up marginally from the previous quarter end. Average total loans and leases of \$310.44 billion declined 3.5% from the prior quarter end.

Credit Quality: Mixed Bag

As of Sep 30, 2020, total non-performing assets (NPAs) were \$1.31 billion, up 5% sequentially. As a percentage of total assets, NPAs were 0.26%, increasing 1 bp from the prior quarter.

Also, allowance for loan and lease losses was 1.91% of total loans and leases held for investment, which increased 10 bps. Net charge-offs were 0.42% of average loans and leases, up 3 bps, sequentially.

However, provision for credit losses declined 50.1% on a sequential basis to \$421 million. Notably, in the reported quarter, provisions included a modest build to the allowance for loan and lease losses primarily due to the uncertainty related to the coronavirus outbreak.

Profitability & Capital Ratios Improve

At the end of the reported quarter, return on average assets was 0.91%, up from 0.75% in the prior quarter. Return on average common equity was 6.87%, up from 5.90% in the second quarter of 2020.

As of Sep 30, 2020, Tier 1 risk-based capital ratio was 12.2%, up from 11.6% recorded in the prior quarter. Common equity Tier 1 ratio was 10% as of Sep 30, 2020, up from 9.7% in the second quarter of 2020.

Fourth-Quarter 2020 Outlook

On a sequential basis, management expects taxable equivalent revenues (excluding one-time security gains) to be down 1-3%, mainly due to lower purchase accounting accretion. Reported NIM is projected to be down 3-5 bps and core NIM is likely to be flat sequentially.

Core non-interest expenses (excluding merger costs and amortization) are anticipated to be down 2-4%, driven by lower personnel expense. Additionally, the company plans to close 104 branches in December and January, and is looking at ways to bring forward more branch closures next year.

NCOs are projected between 40 bps and 60 bps.

Medium-Term Targets

Management expects ROTCE in low 20%, adjusted efficiency ratio in low 50% and CET1 ratio of 10%.

Further, the company has provided net expense savings run rate related to the merger. It projects achieving 40% of net cost saves in 2020 (reflecting fourth-quarter 2020 annualized) and 65% of net cost saves by fourth-quarter 2021. The bank is on track to achieve "run rate net cost

Quarter Ending	09/2020

Recent News

Truist Signs Deals to Sell Institutional Retirement Business - Jan 6, 2021

Truist Financial announced that it has sold its institutional 401(k) investment advisory services business to OneDigital Investment Advisors. Also, it agreed to sell its institutional 401(k) recordkeeping businesses to Ascensus and Empower Retirement. The financial terms of none of the three transactions have been disclosed yet.

The deal with Ascensus and Empower is expected to be completed in first-quarter 2021.

Notably, Ascensus is expected to acquire Truist Financial's heritage BB&T 401(k) recordkeeping business, which includes more than 1,200 retirement plans that consist of 125,000 plan participants and assets worth \$5 billion.

Then again, Empower is set to acquire the heritage SunTrust 401(k) recordkeeping business, including 300 retirement plans, consisting of 73,000 participants and \$5 billion in assets.

The head of wealth for Truist Financial, Joe Thompson, stated, "The institutional 401(k) industry has experienced significant consolidation, and Ascensus, Empower and OneDigital are well-positioned to provide scale and expertise for our plan sponsor clients and their plan participants. Truist will continue to focus on growth opportunities and make strategic investments in our wealth management business that advance our digital capabilities and expand our team of advisors."

Dividend Update

On Oct 27, 2020 Truist Financial announced a quarterly cash dividend of 45 cents per share. The dividend was paid out on Dec 1, 2020 to shareholders of record as of Nov 13.

Valuation

Truist Financial's shares are up 42.3% in the past six month period but down 9.9% over the trailing 12-month period. Stocks in the Zacks sub-industry and the Zacks Finance sector are up 35.5% and 25.7% over the past six months, respectively. Over the past year, the Zacks sub-industry is down 11.2% and the sector is down 0.3%.

The S&P 500 index is up 22% over the past six months and 18.2% in the past year.

The stock is currently trading at 13.85X forward 12 months earnings, which compares to 13.58X for the Zacks sub-industry, 17.33X for the Zacks sector and 23.38X for the S&P 500 index.

Over the past five years, the stock has traded as high as 16.89X and as low as 5.87X, with a 5-year median of 12.39X. Our Neutral recommendation indicates that the stock will perform in line with the market. Our \$53 price target reflects 14.48X forward earnings.

Zacks Stock Rating System

We offer two rating systems that take into account investors' holding horizons: Zacks Rank and Zacks Recommendation. Each provides valuable insights into the future profitability of the stock and can be used separately or in combination with each other depending on your investment style.

Zacks Recommendation

The Zacks Recommendation aims to predict performance over the next 6 to 12 months. The foundation for the quantitatively determined Zacks Recommendation is trends in the company's estimate revisions and earnings outlook. The Zacks Recommendation is broken down into 3 Levels; Outperform, Neutral and Underperform. Unlike many Wall Street firms, we maintain a balance between the number of Outperform and Neutral recommendations. Our team of 70 analysts are fully versed in the benefits of earnings estimate revisions and how that is harnessed through the Zacks quantitative rating system. But we have given our analysts the ability to override the Zacks Recommendation for the 1200 stocks that they follow. The reason for the analyst over-rides is that there are often factors such as valuation, industry conditions and management effectiveness that a trained investment professional can spot better than a quantitative model.

Zacks Rank

The Zacks Rank is our short-term rating system that is most effective over the one- to three-month holding horizon. The underlying driver for the quantitatively-determined Zacks Rank is the same as the Zacks Recommendation, and reflects trends in earnings estimate revisions.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	D
Momentum Score	A
VGM Score	B

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
