Summary

WEX continues to grow organically driven by an extensive network of fuel and service providers, transaction volume growth, product excellence, marketing capabilities, sales force productivity and other strategies. Its U.S. healthcare business remains in great shape. The company has been actively acquiring and investing in companies to expand its product and service offerings. Extensive partner network provides WEX with ample market expansion opportunities. On the flip side, increasing debt to capitalization ratio indicates that the proportion of debt to finance the company's assets is on the rise. Higher debt as a percentage of total capital indicates that the company has a higher risk of insolvency. Further, WEX remains vulnerable to foreign exchange rate risk. Due to these negatives, shares of the company have declined in the past year.

Overview

Headquartered in South Portland, ME, WEX Inc. is a leading provider of payment processing and business solutions across a wide spectrum of sectors, including fleet, travel and healthcare.

Founded in 1983, the company has expanded its scope of business from a fleet payment provider into a multi-channel provider of corporate payment solutions. Currently, WEX operates through three business segments: Fleet Solutions, Travel and Corporate Solutions, and Health and Employee Benefit Solutions.

Fleet Solutions (60% of total revenues in 2018) offers customers with fleet vehicle payment processing services, particularly designed for commercial and government fleets. The segment generates revenues from payment processing, account servicing and financing fees. Management believes that WEX fleet cards are accepted in more than 90% of fuel locations in the United States and Australia. Following the acquisition of European Fleet business in December 2014, WEX fleet cards are accepted at all ExxonMobil stations throughout Europe.

Travel and Corporate Solutions (21%) targets the complex payment environment of business-to-business payments, providing customers with payment processing solutions for their corporate payment and transaction monitoring needs. The segment also offers payment solutions for payables and travel expenses. It mainly generates revenues from the online travel market and operates in North America, South America, Europe and Asia-Pacific.

Health and Employee Benefit Solutions (19%) offers healthcare payment products and software-as-a-service (SaaS) consumer directed platforms for healthcare market, as well as payroll related and employee benefits to customers in Brazil.

The company's U.S. operations include WEX Inc. and its wholly-owned subsidiaries WEX Bank, WEX FleetOne, EFS and WEX Health. International operations include its wholly-owned operations, WEX Fuel Cards Australia, WEX Prepaid Cards Australia, WEX Canada, WEX New Zealand, WEX Asia, WEX Europe Limited, UNIK S.A. (referred as "WEX Latin America") and a controlling interest in WEX Europe Services Limited and its subsidiaries.

As of Dec 31, 2019, WEX and its subsidiaries had more than 50000 employees across the globe.

Source: Zacks Investment Research

Reasons To Buy:

▲ WEX's top line continues to **grow organically** driven by its extensive network of fuel and service providers, transaction volume growth, product excellence, marketing capabilities, sales force productivity and other strategic revenue generation efforts. Robust demand for its payment processing, account servicing and transaction processing services along with operational efficiency has helped WEX achieve solid revenue and earnings growth. Further, the company's strategic acquisitions should complement its organic growth by contributing to revenues, adding differentiation to its products and service offerings and enhancing scalability. The company is highly optimistic about organic growth opportunities across each of its segments.

WEX looks strong on the back of organic growth, strategic acquisitions and partnerships.

▲ **Acquisitions** have acted as a key growth catalyst for WEX. The company has been actively acquiring and investing in companies, both in the United States as well as internationally, to expand its product and service offerings, thereby contributing to revenue growth and enhancing scalability. In 2019 WEX completed several acquisitions. These include Go Fuel Card to expand its Fleet business throughout EG locations in the United States, Europe and Australia; Discovery Benefits to boost its position as a technology platform in the healthcare space and enhance its employee benefits platform; Pavestone Capital to complement its existing Fleet factoring business and Noventis to expand its corporate payments business.

▲ WEX's **Health and Employee Benefit Solutions has been performing extremely well** on the back of increasing number of customer signings, solid sales pipeline and addition and/or renewal of numerous partners (such as Alaris, Consolidated Admin Services, 24HourFlex, Admin America, Alerus Retirement and Benefits and San Bernardino County, associated bank Nova, Stanley Benefits, Boyu Financial). WEX Health (a wholly-owned subsidiary of WEX in the United States) emerged as one of the leading providers of cloud-based healthcare payments technology through the acquisition of Evolution1 in 2014 and Benaissance in 2015. It benefits from higher revenues earned on health savings account assets and SaaS business model and high retention rates. The company has more than 28 million consumers on the WEX Health cloud platform. The latest acquisition of Discovery Benefits has strengthened WEX's position as a leading provider of innovative healthcare technology solution. The company's U.S. healthcare business is expanding and increased revenues by 48% in 2019.

Reasons To Sell:

- ▼ WEX's debt-to-capital ratio of 0.57 was higher than the industry's 0.38 at the end of second-quarter 2020. Higher debt to capitalization ratio indicates that the proportion of debt to finance the company's assets is on the rise and so is the risk of insolvency. Further, cash and cash equivalent balance of \$1.45 billion at the end of the quarter was well below the long-term debt level of \$2.65 billion underscoring that the company **doesn't have enough cash to meet this debt burden**. This may weigh on the company's share price which has declined 20.1% over the past year. However, the cash level can meet the short-term debt of \$119 million.
- ▼ WEX's businesses are affected by **seasonal changes**. While fuel prices are usually higher during the summer benefiting the Fleet Solutions segment, higher online travel sales during the third quarter boost the Travel and Corporate Solutions. Additionally, the company's Health and Employee Benefits Solutions segment experiences seasonality, as consumer spending, correlated with insurance deductibles, is higher in the early of a year.
- ▼ WEX's geographical presence (North America, Europe, South America and Asia-Pacific) makes it vulnerable to the risks associated with **foreign currency exchange rate fluctuations**. As of Dec 31, 2019, the company transacted in 20 different currencies other than the U.S. dollar including Australian dollar, Canadian dollar, Euro, British pound sterling, New Zealand dollar and Brazilian real. Any appreciation or depreciation of the dollar versus these foreign currencies could impact the company's financials. The company incurred net foreign currency loss of \$0.9 million in 2019.

Seasonality, foreign currency exchange risks and high debt continue to hurt WEX's businesses.

Last Earnings Report

WEX Misses on Q2 Earnings & Revenue Estimates

WEX reported lower-than-expected second-quarter 2020 results.

Adjusted earnings of \$1.21 per share (excluding 45 cents from non-recurring items) missed the Zacks Consensus Estimate by 16% and decreased 46.9% year over year. Total revenues of \$347.1 million fell short of the consensus mark by 1.7% and decreased 21.4% year over year.

In response to the WEX's implementation of several cost cut initiatives due to the COVID-19 crisis, the company expects its total saving to be approximately \$60-\$65 million for the year.

Quarter Ending 06/2020

Report Date	Jul 30, 2020
Sales Surprise	-1.69%
EPS Surprise	-15.97%
Quarterly EPS	1.21
Annual EPS (TTM)	8.22

Revenues by Segment

Fleet Solutions revenues (59% of total revenues) decreased 24% year over year to \$204.4 million. The downside was due to weak finance fee revenues and payment processing revenues related to two major North America portfolios.

Average number of vehicles serviced was 15.1 million, up 8% from the year-ago quarter's figure. Total fuel transactions processed fell 17% from the year-ago quarter's tally to 127.9 million. Payment processing transactions fell 19% to 103.1 million. U.S. retail fuel price declined 28.9% from the year ago quarter to \$2.07 per gallon.

Travel and Corporate Solutions revenues (15.7%) of \$54.5 million were down 40% year over year. The downtick can be attributed to weakness in the finance fee revenues and payment processing revenues. The coronavirus pandemic's adverse impact on travel volumes strained the segment's revenues. Purchase volume decreased 68% to \$3.2 billion.

Health and Employee Benefit Solutions revenues (25.4%) of \$88.2 million jumped 6%, year over year, on 15% growth in the average number of Software-as-a-Service (SaaS) accounts in the United States to 14.5 million.

Operating Results

Adjusted operating income decreased 40.2% from the prior-year quarter's figure to \$99.4 million. Adjusted operating income margin declined to 28.7% from the year-ago quarter's 37.7%.

Balance Sheet

WEX exited the second quarter with cash and cash equivalents of \$1.3 billion compared with the \$861.2 million witnessed at the end of the prior quarter. Long-term debt was \$2.7 billion, nearly flat with the previous quarter's reported figure.

Recent News

On **Aug 13, 2020**, WEX announced the launch of its new ClearView Snap voice skill for Amazon Alexa.

On **Jul 30, 2020**, WEX announced that it has inked a multi-year contract extension with Enterprise Fleet Management. The deal further strengthens the persistent alliance between the two organizations, since 1993.

On **Jul 1, 2020**, WEX announced that it recently gave its trucking customers access to its fuel discount network. This network which forms a part of WEX's new WEX EDGE business savings network, allows WEX merchants to offer savings on truck fuel purchases. Customers can access such discounts at thousands of participating locations across the United States, thereby reducing cost and maintaining uninterrupted deliveries amid the coronavirus pandemic.

Valuation

WEX shares are down 22% in the year-to-date period and 20.1% over the trailing 12-month period. Stocks in the Zacks sub-industry and the Zacks Business Services sector are up 9.2% and 4.1% in the year-to-date period, respectively. Over the past year, the Zacks sub-industry and the sector up 11.4% and 5.4%, respectively.

The S&P 500 index is up 3.7% in the year-to-date period and 14.5% in the past year.

The stock is currently trading at 20.38X price to forward 12 months' earnings, which compares to 32.97X for the Zacks sub-industry, 31.36X for the Zacks sector and 23.2X for the S&P 500 index.

Over the past five years, the stock has traded as high as 29.47X and as low as 8.73X, with a 5-year median of 21.34X. Our Neutral recommendation indicates that the stock will perform in-line with the market. Our \$173.00 price target reflects 20.41X forward 12 months' earnings.

Zacks Style Scores

The Zacks Style Score is as a complementary indicator to the Zacks rating system, giving investors a way to focus on the highest rated stocks that best fit their own stock picking preferences.

Academic research has proven that stocks with the best Value, Growth and Momentum characteristics outperform the market. The Zacks Style Scores rate stocks on each of these individual styles and assigns a rating of A, B, C, D and F. We also produce the VGM Score (V for Value, G for Growth and M for Momentum), which combines the weighted average of the individual Style Scores into one score. This is perfectly suited for those who want their stocks to have the best scores across the board.

Value Score	C
Growth Score	B
Momentum Score	F
VGM Score	C

As an investor, you want to buy stocks with the highest probability of success. That means buying stocks with a Zacks Recommendation of Outperform, which also has a Style Score of an A or a B.

Investing involves risk; principal loss is possible. There is no guarantee that companies that can issue dividends will declare, continue to pay or increase dividends.

Glossary of Terms and Definitions

52-Week High-Low: The range of the highest and lowest prices at which a stock has traded during the past year. This range is determined based on the stock's daily closing price which may differ from the intra-day high or low. Many investors use it as a technical indicator to determine a stock's current value and future price movement. The idea here is that if price breaks out from the 52-week range, in either direction, the momentum may continue in the same direction.

20-Day Average Volume (Shares): The average number of shares of a company traded in a day over the last 20 days. It is a direct indication of a security's overall liquidity. The higher the average daily trading volume, the easier it is to enter or exit the stock at a desired price with more buyers and sellers being available.

Daily Price Change: This is the percentage difference between a trading day's closing price and the prior trading day's closing price. This item is updated at 9 p.m. EST each day.

1-Week Price Change: This is the percentage change in a stock's closing price over the last 5 trading days. This change reflects the collective buying and selling sentiment over the 1-week period.

A strong weekly price increase for the stock, especially when accompanied by increased volume, is an indication of it gaining momentum.

4-Week Price Change: This is the percentage change in a stock's closing price over the last 20 trading days or past 4 weeks. This is a medium-term price change metric and an indication of the stock gaining momentum.

12-Week Price Change: This is the percentage change of a stock's closing price over the last 60 trading days or past 12 weeks. Similar to 4-week price change, this is a medium-term price change metric. It shows whether a stock has been enjoying strong investor demand, or if it has been in consolidation, or distress over this period.

52-Week Price Change: This is the percentage change in a stock's closing price over the last 260 trading days or past 52 weeks. This long-term price change metric is a good reference point for investors. Some investors seek stocks with the best percentage price change over the last 52 weeks, expecting the momentum to continue.

Market Cap: The number of outstanding common shares of a company times its latest price per share. This figure represents a company's size, which indicates various characteristics, including price stability and risk, in which investors could be interested.

Year-To-Date Price Change: Change in a stock's daily closing price in the period of time beginning the first day of the current calendar year through to the previous trading day.

of Analysts: Number of EPS estimates used in calculating the current-quarter consensus. These estimates come from the brokerage analysts tracking this stock. However, the number of such analysts tracking this stock may not match the number of estimates, as all brokerage analysts may not come up with an estimate or provide it to us.

Beta: A measure of risk commonly used to compare the volatility of a stock to the overall market. The S&P 500 Index is the base for calculating beta and carries a value of 1. A stock with beta below 1 is less risky than the market as a whole. And a stock with beta above 1 is riskier.

Dividend: The portion of earnings a company is expected to distribute to its common shareholders in the next 12 months for each share they own. Dividends are usually paid quarterly. Dividend payments reflect positively on a company and help maintain investors' trust. Investors typically find dividend-paying stocks appealing because the dividend adds to any market price appreciation to result in higher return on investment (ROI). Moreover, a steady or increasing dividend payment provides investors a cushion in a down market.

Dividend Yield: The ratio of a company's annual dividend to its share price. The annual dividend used in the ratio is calculated based on the most recent dividend paid by the company. Dividend yield is an estimate of the dividend-only return from a stock in the next 12 months. Since dividend itself doesn't change frequently, dividend yield usually changes with a stock's price movement. As a result, often an unusually high dividend yield is a result of weak stock price.

S&P 500 Index: The Standard & Poor's 500 (S&P 500) Index is an unmanaged group of securities considered to be representative of the stock market in general. It is a market-capitalization-weighted index of stocks of the 500 largest U.S. companies. Each stock's weight in the index is proportionate to its market value.

Industry: One of the 250+ groups that Zacks classifies all stocks into based on the nature of business. These groups are termed as expanded (aka "X") industries and map to their respective (economic) sectors; Zacks has 16 sectors.

Zacks Industry Rank: The Zacks Industry Rank is determined by calculating the average Zacks Rank for all stocks in the industry and then assigning an ordinal rank to it. For example, an industry with an average Zacks Rank of 1.6 is better than an industry with an average Zacks Rank of 2.3. So, the industry with the better average Zacks Rank would get a better Zacks Industry Rank. If an industry has the best average Zacks Rank, it would be considered the top industry (1 out of 250+), which would place it at the top 1% of Zacks-ranked industries. Studies have shown that roughly half of a stock's price movement can be attributed to the industry group it belongs to. In fact, the top 50% of Zacks-ranked industries outperforms the bottom 50% by a factor of more than 2 to 1.

Last EPS Surprise: The percentage deviation of a company's last reported earnings per share from the Zacks Consensus Estimate. Companies with a positive earnings surprise are more likely to surprise again in the future (or miss again if they recently missed).

Last Sales Surprise: The percentage deviation of a company's last reported sales from the Zacks Consensus Estimate.

Expected Report Date: This is an estimated date of a company's next earnings release. The information originated or gathered by Zacks Investment Research from its information providers or publicly available sources is the basis of this estimate.

Earnings ESP: The Zacks Earnings ESP compares the Most Accurate Estimate to the Zacks Consensus Estimate for the yet-to-be reported quarter. The Most Accurate Estimate is the most recent version of the Zacks Consensus EPS Estimate. The idea here is that analysts revising their estimates closer to an earnings release have the latest information, which could potentially be more accurate than what they and others contributing to the consensus had predicted earlier. Thus, a positive or negative Earnings ESP reading theoretically indicates the likely deviation of the actual earnings from the consensus estimate. However, the model's predictive power is significant for positive ESP readings only. A positive Earnings ESP is a strong predictor of an earnings beat, particularly when combined with a Zacks Rank #1 (Strong Buy), #2 (Buy) or #3 (Hold). Our research shows that stocks with this combination produce a positive surprise nearly 70% of the time.

Periods:

TTM: Trailing 12 months. Using TTM figures is an effective way of analyzing the most-recent financial data in an annualized format that helps neutralize the effects of seasonality and other quarter-to-quarter variation.

F1: Current fiscal year. This period is used to analyze the estimates for the ongoing full fiscal year.

F2: Next fiscal year. This period is used to analyze the estimates for the next full fiscal year.

F12M: Forward 12 months. Using F12M figures is an effective way of analyzing the near-term (the following four unreported quarters) estimates in an annualized manner. Instead of typically representing estimates for the full fiscal year, which may not represent the nitty-gritty of each quarter, F12M figures suggest an all-inclusive annualized estimate for the following four quarters. The annualization helps neutralize the potential effects of seasonality and other quarter-to-quarter variations.

P/E Ratio: The price-to-earnings ratio measures a company's current market price per share relative to its earnings per share (EPS). Usually, the trailing-12-month (TTM) EPS, current-fiscal-year (F1) EPS estimate, or forward-12-month (F12M) EPS estimate is used as the denominator. In essence, this ratio shows what the market is willing to pay today for each dollar of EPS. In other words, this ratio gives a sense of what the relative value of the company is at the already reported level of earnings or at a future level of earnings.

It is one of the most widely-used multiples for determining the value of a company and helps comparing its valuation with that of a competitor, the industry group or a benchmark.

PEG Ratio: The price/earnings to growth ratio is a stock's P/E ratio using current fiscal year (F1) EPS estimate divided by its expected EPS growth rate over the coming 3 to 5 years. This ratio essentially determines a stock's value by factoring in the company's expected earnings growth and is thus believed to provide a more complete picture than just the P/E ratio, particularly for faster-growing companies.

P/S Ratio: The price-to-sales ratio is calculated as a company's current price per share divided by trailing 12 months (TTM) sales or revenues per share. This ratio shows what the market is willing to pay today for each dollar of TTM sales per share. The P/S ratio is at times the only valuation metric when the company has yet to become profitable.

Cash/Price Ratio: The cash-to-price ratio or Cash Yield is calculated as cash and marketable securities per share divided by the company's current share price. Like the earnings yield, which shows the anticipated yield (or return) on a stock from earnings for each dollar invested, the cash yield does the same, with cash being the source of return instead of earnings. For example, a cash/price ratio of 0.08 suggests a return of 8% or 8 cents for every \$1 investment.

EV/EBITDA Ratio: The EV/EBITDA ratio, also known as Enterprise Multiple, is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by EBITDA (earnings before interest, taxes, depreciation and amortization). Usually, trailing-12-month (TTM) or forward-12-month (F12M) EBITDA is used as the denominator.

EV/Sales Ratio: The enterprise value-to-sales ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by annual sales. It is an expansion of the P/S valuation, which uses market value instead of enterprise value. The EV/Sales ratio is perceived as more accurate than P/S, in part, because the market capitalization does not take a company's debt into account when valuing it.

EV/CF Ratio: The enterprise value-to-cash flow ratio is calculated as a company's enterprise value (market capitalization + value of total long-term debt + book value of preferred shares - cash and marketable securities) divided by the trailing-12-month (TTM) operating cash flow. It's a measure of how long it would take to buy the entire business if you were able to use all the company's operating cash flow.

The EV/CF ratio is perceived as more accurate than the P/CF ratio, in part, because the market price does not take a company's debt into account when valuing it.

EV/FCF Ratio: The enterprise value-to-free cash flow metric compares a company's enterprise value to its trailing-12-month (TTM) free cash flow (FCF). This metric is very similar to the EV/CF ratio, but is considered a more exact measure owing to the fact that it uses free cash flow, which subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding growth activities and payments to shareholders.

P/EBITDA Ratio: The P/EBITDA ratio is calculated as a company's per share market value divided by EBITDA (earnings before interest, taxes, depreciation, and amortization). This metric is very similar to the EV/EBITDA ratio, but is considered a little less exact measure as it uses market price, which does not take a company's debt into account. However, since EBITDA is often considered a proxy for cash income, the metric is used as a measure of what the market is willing to pay today for each dollar of the company's cash profitability in the trailing 12 months (TTM) or forward 12 months (F12M).

P/B Ratio: The price-to-book ratio is calculated as a company's current price per share divided by its book value (total assets – liabilities – preferred stocks) per share. In short, the book value is how much a company is worth. In other words, it reflects the total value of a company's assets that its common shareholders would receive if it were to be liquidated. So, the P/B ratio indicates whether you're paying higher or lower than what would remain if the company went bankrupt immediately. Investors typically use this metric to determine how a company's stock price stacks up to its intrinsic value.

P/TB Ratio: The price-to-tangible-book value ratio is calculated as a the per share market value of a company divided by the value of its tangible assets (total assets – liabilities – preferred stocks – intangible assets) per share. Tangible book value is the same thing as book value except it excludes the value of intangible assets to get a step closer to the baseline value of the company.

P/CF Ratio: The price-to-cash flow ratio measures a company's per share market price relative to its trailing-12-month (TTM) operating cash flow per share. This metric is used to determine whether a company is undervalued or overvalued relative to another stock, industry or sector. And like the P/E ratio, a lower number is typically considered better from the value perspective.

One of the reasons why P/CF ratio is often preferred over P/E ratio is the fact that operating cash flow adds back non-cash expenses such as depreciation and amortization to net income. This feature helps valuing stocks that have positive cash flow but are not profitable because of large noncash charges.

P/FCF Ratio: The price-to-free cash flow ratio is an extension of P/CF ratio, which uses trailing-12-month (TTM) free cash flow per share instead of operating cash flow per share. This metric is considered a more exact measure than P/CF ratio, as free cash flow subtracts capital expenditures (CAPEX) from a company's total operating cash flow, thereby reflecting the actual cash flow available for funding activities that generate additional revenues.

Earnings Yield: The earnings yield is calculated as current fiscal year (F1) EPS estimate divided by the company's current share price. The ratio, which is the inverse of the P/E ratio, measures the anticipated yield (or return) from earnings for each dollar invested in a stock today.

For example, earnings yield for a stock, which is trading at \$35 and expected to earn \$3 per share in the current fiscal year (F1), would be 0.0857 ($3/35 = 0.0857$) or 8.57%. In other words, for \$1 invested in the stock today, the yield from earnings is anticipated to be 8.57 cents.

Investors most commonly compare the earnings yield of a stock to that of a broad market index (such as the S&P 500) and prevailing interest rates, such as the current 10-year Treasury yield. Since bonds and stocks compete for investors' dollars, stock investors typically demand a higher yield for the extra risk they assume compared to investors of U.S. Treasury-backed securities that offer virtually risk-free returns. This additional return is referred to as the risk premium.

Debt/Equity Ratio: The debt-to-equity ratio is calculated as a company's total liabilities divided by its shareholder equity. This metric is used to gauge a company's financial leverage. In other words, it is a measure of the degree to which a company is financing its operations through debt versus its own funds. The higher the ratio, the higher the risk for shareholders.

However, this ratio is difficult to compare across industry groups where ideal amounts of debt vary. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-equity ratio should be compared with other companies in the same industry.

Cash Flow (\$/share): Cash flow per share is calculated as operating cash flow (after-tax earnings + depreciation + other non-cash charges) divided by common shares outstanding. It is used by many investors as a measure of a company's financial strength. Since cash flow per share takes into consideration a company's ability to generate cash by adding back non-cash expenses, it is regarded by some as a more accurate measure of a company's financial situation than earnings per share, which could be artificially deflated.

Current Ratio: The current ratio or liquidity ratio is a company's current assets divided by its current liabilities. It measures a company's ability to pay short-term obligations. A current ratio that is in line with the industry average or slightly higher is generally considered acceptable. A current ratio that is lower than the industry average would indicate a higher risk of distress or default. A higher number is usually better. However, a very high current ratio compared to the industry average could be an indication of inefficient use of assets by management.

Debt/Capital Ratio: Debt-to-capital ratio is a company's total debt (interest-bearing debt + both short- and long-term liabilities) divided its total capital (interest-bearing debt + shareholders' equity). It is a measure of a company's financial leverage. All else being equal, the higher the debt-to-capital ratio, the riskier the stock.

However, this ratio can vary widely from industry to industry, the ideal amount of required debt being different. Some businesses are more capital intensive than others and typically require higher debt to finance their operations. So, a company's debt-to-capital ratio should be compared with the same for its industry.

Net Margin: Net margin is calculated as net income divided by sales. It shows how much of each dollar in sales generated by a company translates into profit. For example, if a company's net margin is 15%, its net income is 15 cents for every \$1 of sales it makes.

A change in margin can reflect either a change in business conditions, or a company's cost controls, or both. If a company's expenses are growing faster than sales, its net margin will decline. However, different net margin rates are considered good for different industries, so it's better to compare net margin rates of companies in the same industry group.

Return on Equity: Return on equity (ROE) is calculated as trailing-12-month net income divided by trailing-12-month average shareholder equity (including reinvested earnings). This metric is considered a measure of how effectively management is using a company's assets to generate profits. For example, if a company's ROE is 10%, it creates 10 cents profits for every \$1 shareholder equity, which is basically the company's assets minus debt. A company's ROE deemed good or bad depends on what's normal for its peers or industry group.

Sales/Assets Ratio: The sales-to-assets ratio or asset utilization ratio or asset turnover ratio is calculated as a company's annual sales divided by average assets (average of assets at the beginning of the year and at the year's end). This metric helps investors understand how effectively a company is using its assets to generate sales. For example, a sales-to-assets ratio of 2.5 indicates that the company generated \$2.50 in sales for every \$1 of assets on its books.

The higher the sales-to-assets ratio, the better the company is performing. However, similar to many other ratios, the asset turnover ratio tends to be higher for companies in certain industries/sectors than in others. So, a company's sales-to-assets ratio should be compared with the same for its industry/sector.

Historical EPS Growth (3-5 Years): This is the average annual (trailing-12-month) EPS growth rate over the last 3-5 years. This metric helps investors see how a company's EPS has grown from a long-term perspective.

Note: There are many factors that can influence short-term numbers — a recession will reduce this number, while a recovery will inflate it. The longterm perspective helps smooth out short-term events.

Projected EPS Growth (F1/F0): This is the estimated EPS growth rate for the current financial year. It is calculated as the consensus estimate for the current fiscal year (F1) divided by the reported EPS for the last completed fiscal year (F0).

Current Cash Flow Growth: It measures the latest year-over-year change in operating cash flow. Cash flow growth tells an investor how quickly a company is generating inflows of cash from operations. A positive change in the cash flow is desired and shows that more 'cash' is coming in than going out.

Historical Cash Flow Growth (3-5 Years): This is the annualized change in cash flow over the last 3-5 years. The change in a longer period helps put the current reading into proper perspective. By looking at the rate, rather than the actual dollar value, the comparison across the industry and peers becomes easier.

Projected Sales Growth (F1/F0): This metric looks at the estimated sales growth for the current year. It is calculated as sales estimate for the current fiscal year (F1) divided by the reported sales for the last completed fiscal year (F0).

Like EPS growth, a higher rate is better for sales growth. A look at a company's projected sales growth instantly tells you what the outlook is for their products and services. However, different sales growth rates are considered good for different industries, so it's better to compare sales growth rates of companies in the same industry group.

EPS F1 Estimate 1-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past week. The change in a company's consensus EPS estimate (or earnings estimate revision) has proven to be strongly correlated with the near-term price movement of its shares. It is an integral part of the Zacks Rank.

If a stock's consensus EPS estimate is \$1.10 now versus \$1.00 a week ago, that will be reflected as a 10% upward revision. If, on the other hand, it went from \$1.00 to 90 cents, that would be a 10% downward revision.

EPS F1 Estimate 4-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past four weeks.

A stock's earnings estimate revision in a 1-week period is important. But it's more meaningful to look at the longer-term revision. And, of course, the 4-week change helps put the 1-week change into proper perspective.

EPS F1 Estimate 12-Week Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal year over the past 12 weeks.

This metric essentially shows how the consensus EPS estimate has changed over a period longer than 1 week or 4 weeks.

EPS Q1 Estimate Monthly Change: The percentage change in the Zacks Consensus EPS estimate for the current fiscal quarter over the past four weeks.

While the revision in consensus EPS estimate for the current fiscal year is strongly correlated with the near-term price movement of its shares, the estimate revision for the current fiscal quarter is an important metric as well, especially over the short term, and particularly as a stock approaches its earnings date. If a stock's Q1 EPS estimate decreases ahead of its earnings release, it's usually a negative sign, whereas an increase is a positive sign.
